1   **1   OVERVIEW**

2  
3       NS Power's 2013 General Rate Application (GRA), filed May 8, 2012, seeks approval of  
4       projected revenue requirements for two years: 2013 and 2014. We've made this unusual,  
5       two-year application as part of a broader Rate Stabilization Plan that would limit rate  
6       increases for all customer classes to 3 percent in 2013 and a further 3 percent in 2014.  
7       The plan would defer recovery of the remaining, Board-approved revenue requirements  
8       to future years. NS Power believes a Rate Stabilization Plan is needed to help  
9       homeowners and businesses plan their future energy expenditures in the face of the  
10      extraordinary pressures currently bearing on electricity rates.

11  
12      Subsequent to our initial filing, in June Bowater Mersey Paper Company Limited  
13      (Bowater) announced that it would close. The loss of NS Power's largest remaining  
14      customer, and our forecast that loss of load will continue due to economic and industrial  
15      uncertainty and demand side management programs, underscores the need for a Rate  
16      Stabilization Plan. Major load losses force remaining customers to shoulder the fixed  
17      costs of an electricity system that has been built to accommodate a larger load and that  
18      cannot be quickly reduced. Customers need time to adjust to the reality of increased  
19      responsibility for the costs of the system.

20  
21      On August 20, the Board issued its decision in the Pacific West Commercial Corporation  
22      Load Retention proceeding granting conditional approval for Load Retention Tariff  
23      pricing and dividend calculation mechanism. The Port Hawkesbury mill will hopefully  
24      reopen under the approved Tariff, assuming receipt of the Canada Revenue Agency  
25      Advance Tax Ruling in respect of the tax structure for the mill.

26  
27      As part of the PWCC proceeding, NS Power sought approval for the continuation of the  
28      2012 General Rate Application (GRA) fixed cost recovery (FCR) deferral. The Board  
29      approved this request, subject to any amendments which may be ordered through the  
30      GRA. This allows NS Power to ensure that every dollar of fixed cost contribution that is

**NS Power 2013 General Rate Application Reply Evidence**

**REDACTED**

1 received from the mill is used to benefit our customers by using those funds to reduce the  
 2 Fixed Cost Deferral. Converting the approved Fixed Cost Deferral by incorporating it  
 3 into the Rate Stabilization Plan is a key component of the requested approval for 2013  
 4 and 2014.

5  
 6 On August 31, NS Power filed its updated load and fuel forecast, as required by the Fuel  
 7 Adjustment Mechanism (FAM). Section 2 of this Reply Evidence discusses the details of  
 8 this update. Based upon this updated load and fuel forecast, NS Power has also updated  
 9 the 2013 and 2014 revenue requirement calculations and the calculation of the Rate  
 10 Stabilization Plan deferral.

11  
 12 NS Power's 2013 and 2014 revenue requirement is lower than forecast in our May 8  
 13 filing, as a result of the August 31 load and fuel forecast update. Due mainly to the  
 14 recently announced shutdown of the Bowater paper mill, NS Power's total forecast  
 15 energy requirement for 2013 has fallen from 10,750.9 GWh (May 8 forecast) to 9,879.3  
 16 GWh (August 31 forecast). Similarly, the total forecast energy requirement for 2014 has  
 17 fallen from 10,739.9 GWh (May 8) to 9,847.2 GWh (August 31). This change has  
 18 reduced the revenue requirement for fuel expenses by \$53.3 million in 2013 and \$62.8  
 19 million in 2014. Figure 1-1 summarizes these changes.

20  
 21 **Figure 1-1**

19  
20  
21

In accordance with these changes, the Company has also updated its cost of service studies and revenue allocation analyses for 2013 and 2014. NS Power continues to seek approval for a Rate Stabilization Plan, which would result in a 3 percent increase in each of 2013 and 2014, plus deferred recovery of any Board-approved forecast revenue requirement not recovered in 2013 and 2014 by the 3 percent increases. Recovery of the deferral will commence in 2015.

For illustrative purposes, we have updated the traditional cost allocations for all classes in order to show the rate increase that would be required if not for the Rate Stabilization Plan. Please refer to Appendix A for details.

NS Power seeks a Rate Stabilization Plan that will hold rate increases for all classes to three percent in each of 2013 and 2014, with the remainder deferred for recovery in later years. We have recalculated the deferral, and the allocation of the deferral to the various customer classes, to reflect the updated fuel and load projections.

Lost industrial load causes lower overall fuel costs, but it also is accompanied by lost revenue contributions, specifically lost fixed cost contributions. With lower revenue and lower fixed cost contributions, the amount of the deferral has increased from \$124.4 million to \$130.7 million. This result is in line with the overall system load economics of

**NS Power 2013 General Rate Application Reply Evidence**

**REDACTED**

1 a power system typified by the presence of significant fixed costs. As system load goes  
 2 down only variable fuel-related costs can be avoided in the short term. The non-fuel  
 3 related costs remain unchanged. With the marginal costs falling from approximately \$55  
 4 to \$50 per MWh the net avoided fuel related costs<sup>1</sup> are not sufficient to compensate for  
 5 the forgone recovery of fixed costs associated with the system load reduction.

6  
 7 Figure 1-2 provides a comparison of changes in the main drivers behind the deferral cost  
 8 calculations from the May and August submissions.

9  
 10 **Figure 1-2**

<b>Revenues with FAM Riders</b>							
	<b>May Submission</b>		<b>August Update</b>		<b>Variance</b>		
	2013	2014	2013	2014	2013	2014	Two Test Years Combined
GWh Requirement	10,750.9	10,739.9	9,879.3	9,847.2	(871.6)	(892.7)	(1,764.3)
Revenue Increase before Rate Stabilization Plan							
Revenue at Current Rates	\$1,260.8	\$1,349.6	\$1,202.5	\$1,295.9	(\$58.3)	(\$53.7)	(\$112.0)
Revenue Requirement	\$1,352.2	\$1,387.9	\$1,298.8	\$1,325.1	(\$53.3)	(\$62.8)	(\$116.1)
Increase	\$91.3	\$38.3	\$96.3	\$29.2	\$5.0	(\$9.1)	(\$4.1)
Revenue Increase under Rate Stabilization Plan							
Revenue at Current Rates	\$1,260.8	\$1,293.2	\$1,202.5	\$1,228.1	(\$58.3)	(\$65.1)	(\$123.4)
Revenue Proposed	\$1,296.1	\$1,328.6	\$1,238.5	\$1,264.4	(\$57.5)	(\$64.3)	(\$121.8)
Deferral							
Before Interest	\$56.1	\$59.3	\$60.3	\$60.7	\$4.2	\$1.5	\$5.7
With Interest	\$62.9	\$61.6	\$67.6	\$63.1	\$4.7	\$1.5	\$6.2
Cumulative with interest		\$124.4		\$130.7			\$6.2

11  
 12  
 13 Appendix B provides details of the calculation of \$130.7 and allocation of this amount  
 14 among rate classes, which is provided for illustrative purposes only.

<sup>1</sup> The net avoided fuel costs represent a difference between avoided fuel costs and forgone recovery of average fuel costs.

## NS Power 2013 General Rate Application Reply Evidence

**REDACTED**

---

1           Our May 8 filing began the discovery and pre-hearing evidence process for our  
2           application. Board Consultants, Board Staff and intervenors posed two rounds of  
3           Information Requests (IRs) to NS Power. We responded to a total of 807 IRs (452 on  
4           June 25, and 355 on July 23).

5  
6           On August 7, Board Counsel Consultants, the Consumer Advocate, the Small Business  
7           Advocate, Alton Natural Gas Storage LP, Halifax Regional Municipality, the Union of  
8           Nova Scotia Municipalities and the Affordable Energy Coalition filed intervenor  
9           Evidence. On August 28, these consultants and intervenors filed their responses to IRs  
10          put to them by NS Power and other intervenors.

11  
12          This Reply evidence responds to the items identified in the evidence of these consultants  
13          and parties.

REDACTED

---

1    **2    FUEL AND PURCHASED POWER**

2  
3       Three parties submitted evidence in relation to NS Power's fuel and purchased power  
4       forecast: Board Counsel, through The Liberty Consulting Group (Liberty), the Small  
5       Business Advocate, through Lee Smith, and Alton Natural Gas Storage LP (Alton),  
6       through David Birkett, Richmond Graham, Greg Hopper, and Jan van Egerton. This  
7       section of our Reply Evidence provides NS Power's response to their fuel-related  
8       evidence. We also comment on the 2013 load and fuel update filed August 31.

9  
10       Of the three parties that submitted evidence on fuel and purchased power, Liberty was the  
11       only party to make specific recommendations for adjustments to our fuel and purchased  
12       power forecasts for 2013 and 2014.

13  
14    **2.1   Fuel and Purchased Power Update**

15  
16       In June, Resolute Forest Products announced the indefinite shutdown of its Bowater  
17       Mersey paper mill in Liverpool, Nova Scotia. The Board had already placed Bowater on  
18       a Load Retention Rate, effective January 1, 2012, under which it paid its incremental  
19       costs, plus a \$4/MWh contribution to fixed costs. This tariff rate covered only a portion  
20       of Bowater's total load. The Mersey Contract, an agreement between Bowater and NS  
21       Power, provides for additional electricity at a rate stipulated in the contract.

22  
23       The updated Fuel forecast reflects the loss of Bowater as well as other forecast sales  
24       losses in other customer classes. Please refer to Exhibit N-103, the August 31, 2012 Fuel  
25       and Purchased Forecast for details.

26  
27    **2.2   2014 and 2013 Fuel Forecasts**

28  
29       Liberty's evidence acknowledges the challenges NS Power and other utilities face in  
30       forecasting 2013 and 2014 natural gas prices. Gas prices ultimately influence the amount

## NS Power 2013 General Rate Application Reply Evidence

**REDACTED**

---

1 of coal we burn (and our coal inventory levels), and the amount of power we purchase.  
2 Under the FAM, NS Power will recover all of its prudently incurred fuel costs. The FAM  
3 also includes an incentive to encourage efficient fuel management. If actual costs come in  
4 below the FAM forecast, NS Power is entitled to keep 10 percent of the variance, to a  
5 maximum incentive of \$5 million. By the same token, if fuel prices exceed our forecast,  
6 NS Power is only able to collect 90 percent of the difference, to a maximum penalty of \$5  
7 million. The existence of this incentive band has resulted in the unintended consequence  
8 of making the forecast a topic of intense interest during the rate setting process.  
9

10 Under NS Power's two-year rate proposal, FAM rates will not change in 2013 and 2014,  
11 and the FAM incentive will not operate. The FAM adjustments that would occur during  
12 2013 and 2014 will be recovered after 2014. Consequently, the objective of this forecast  
13 is to be as accurate as possible in the face of market uncertainties.  
14

15 As stated in our evidence the uncertainties are significant.  
16

17 Uncertainty around the status of our largest industrial customers, together with our  
18 increased use of natural gas, has made it harder to predict how much solid fuel and  
19 natural gas we will consume. Uncertainty about the amount of coal we will use also  
20 causes uncertainty around the optimal mix of solid fuels. Lower gas prices allow us to  
21 meet emissions limits using less expensive coal and petcoke. For these reasons, we  
22 continually monitor our purchase commitments and expected requirements to give  
23 ourselves maximum flexibility in deciding when and what to buy. NS Power has been  
24 able to make large shifts in the amount of solid fuel and natural gas we use from year to  
25 year, so as to take advantage of price changes in these commodities relative to one  
26 another.  
27

28 NS Power's forecast follows the Board's approved forecast methodology, subject to  
29 adjustments in order to establish a multi-year forecast which is not anticipated by the  
30 methodology. The forecast methodology was developed collaboratively with Liberty and

REDACTED

---

1 intervenors, and embedded in the FAM Plan of Administration. In NS Power's view,  
2 changes to the forecast methodology should be an outcome of a similar collaborative  
3 exercise involving stakeholders, rather than adopted on an ad hoc basis during rate setting  
4 processes. A more thoughtful and collaborative approach to changes to the FAM would  
5 align with how the FAM and fuel forecasting methodology were initially established.  
6

7 With three exceptions, Liberty's review concluded that NS Power's 2013 and 2014 fuel  
8 and purchased power forecasts are acceptable. This section provides NS Power's response  
9 to these exceptions, which involve low sulphur coal purchases, natural gas pricing, and  
10 imported power. Although Liberty did not question NS Power's forecast biomass costs,  
11 it did provide comments and recommendations about them, and this section also responds  
12 to those biomass recommendations.  
13

14 Aside from the below response, NS Power notes that at page 8 of its evidence Liberty  
15 notes that "Liberty's review found coal prices for 2013 Powder River Basin coal  
16 delivered to Lingan and Point Aconi too high by approximately \$60,000. NS Power has  
17 stated that it will correct the price forecasts in the fuel forecast update at the end of  
18 August."<sup>2</sup> Liberty's review did not uncover this issue. NS Power discovered this error  
19 and advised of it its intention to make the adjustment in response to Liberty IR-11. NS  
20 Power confirms that this adjustment has been reflected in the August 31, 2012 Update.  
21

### 22 **2.2.1 Subsequent Low Sulphur Coal Purchases**

23

24 NS Power confirms that subsequent to the preparation of the GRA forecast, NS Power  
25 entered into an additional contract for low sulphur coal. The contract is for [REDACTED]  
26 [REDACTED] of coal for [REDACTED]. As required by the FAM Plan of Administration (POA),  
27 information about this contract is available for Liberty and other parties to review. It has  
28 been included in the August 31 fuel forecast update.

---

<sup>2</sup> Liberty Evidence, August 7, 2012, page 8, lines 1-3.

REDACTED

---

1 **2.2.2 Natural Gas Pricing**

2  
3 NS Power disagrees with Liberty's FAM Audit findings about the way natural gas  
4 purchased by NS Power is priced in the current market. Liberty bases its conclusions on  
5 a fundamental misunderstanding of the Maritimes natural gas market, which it  
6 compounds with speculative assumptions. As a result, Liberty's proposed adjustments to  
7 the price of natural gas in the 2013 and 2014 test years should be rejected. NS Power's  
8 response to the FAM Audit Report provides extensive expert evidence to support this  
9 conclusion. The Board has established hearing dates for the FAM Audit Report, and  
10 proposes to deal with these issues at that time. NS Power welcomes the opportunity to  
11 further explain its position on this matter as part of the FAM Audit hearing. In the  
12 interim, the Liberty conclusions and recommendations should not be adopted as the basis  
13 for changes to NS Power's 2013 and 2014 fuel forecast.

14  
15 On behalf of the Small Business Advocate, consultant Lee Smith has also referred to the  
16 Liberty audit findings, stating,

17  
18 These findings suggest that the two year forecast presented in this  
19 proceeding may not reflect appropriate minimization of fuel costs. While  
20 this will be explored more fully in testimony submitted on the audit, I will  
21 discuss the potential impact of any refunds or cost reductions resulting  
22 from the audit in Section IV.<sup>3</sup>  
23

24 Section IV of Ms. Smith's evidence does not actually speak to the potential impact on  
25 refunds or cost reductions resulting from the audit. Ms. Smith provides no specific  
26 recommendation for reductions to the 2013 or 2014 fuel forecast. The only evidence  
27 before the Board that recommends specific adjustments in this regard is the Liberty  
28 testimony.

---

<sup>3</sup> Direct Testimony of Lee Smith, August 4, 2012, page 7, lines 95-99.

REDACTED

---

1 Liberty argues NS Power should use a [REDACTED] price as opposed to [REDACTED]  
2 ([REDACTED]  
3 [REDACTED]). The effect of this recommendation, if accepted, would be to  
4 artificially lower the Base Cost of Fuel forecast. Since it is essentially an incorrect and  
5 artificial reduction in the Base Cost of Fuel, this would simply cause a larger 2014 Actual  
6 Adjustment (AA) that will need to be recovered from customers in 2015. Such an  
7 approach is not the best option for customers, and does not comport with good utility  
8 practice.

9  
10 Liberty's recommended adjustments to forecast natural gas prices assume the Board's  
11 acceptance of the position Liberty took in the 2012 Audit, which NS Power has urged the  
12 Board to reject in its entirety. NS Power respectfully submits that before accepting or  
13 rejecting Liberty's recommendations on gas price forecasts for the 2013 and 2014 test  
14 years, the Board should first determine the outcome of the FAM Audit. NS Power relies  
15 upon its evidence and the evidence of its external experts in respect of these matters. We  
16 respectfully suggest there is no useful purpose to be served by debating these matters in  
17 the General Rate Application portion of this process.

### 18 19 **2.2.3 Imported Power**

20  
21 Liberty correctly explains NS Power's forecast methodology for purchased power, but  
22 seeks two adjustments that would be ad hoc changes to the established fuel forecast  
23 methodology. The first relates to term purchases; the second to peak and off-peak  
24 pricing. To quantify the term purchase adjustment, Liberty relies on 2011 results; to  
25 quantify the peak/off-peak adjustment, Liberty relies on 2010/2011 results. Liberty's  
26 proposed adjustments are inconsistent with NS Power's integrated price forecasts for  
27 2013 and 2014, which reflect [REDACTED] than experienced in 2011. Given the  
28 [REDACTED] and the related impact on import power pricing,  
29 the adjustments should not be tied to 2010 and 2011 results.

REDACTED

---

1 **2.2.4 Biomass Costs**

2  
3 Liberty says it has no basis to contest the accuracy of NS Power's biomass fuel costs  
4 estimates. It does however flag several items for future review. Liberty seeks  
5 information about the accounting for performance deposit installments from New Page  
6 Port Hawkesbury (NPPH). It seeks to review and verify the allocation of costs between  
7 rate base and operations & maintenance expenditures after plant completion. It proposes  
8 an ongoing review of the allocation of non-fuel and operations & maintenance costs. It  
9 seeks confirmation that fuel costs are subject to the same reviews that apply to other fuel  
10 and energy costs.

11  
12 On the last item, NS Power submits that the FAM will review and report upon biomass  
13 fuel costs just as it does other fuel and energy costs. On Liberty's other  
14 recommendations, consistent with the Board's process, NS Power will submit its final  
15 costing once the biomass work order project is complete. NS Power will account for  
16 performance deposits in accordance with US Generally Accepted Accounting Principles  
17 (USGAAP).

18  
19 NS Power submits that the FAM and normal capital processes provide appropriate review  
20 for the accounting of this project's costs. Accounting will be carried out in a manner  
21 consistent with US GAAP and the FAM. There is no need for additional ongoing review  
22 beyond the well-established regulatory processes already in place.

23  
24 **2.3 Inventory Levels**

25  
26 Liberty says it is disappointed with NS Power's inventory performance in 2013 and 2014.  
27 No adjustments to revenue requirement or the fuel forecast are proposed by Liberty. In  
28 respect of our solid fuel inventory, NS Power respectfully states:

REDACTED

---

- 1           •     The projected end-of-year inventory quantities for 2013 and 2014 at the time of  
2           the GRA filing [REDACTED], which is consistent with minimum  
3           target inventory levels  
4  
5           •     NS Power has [REDACTED], which provides us  
6           flexibility to manage stockpile levels for that year, and  
7  
8           •     Basing inventory targets on forecast coal burns may result in insufficient  
9           inventory volumes when lower coal burns are forecast.

10  
11           With respect, there is no reason for the Board to adopt Liberty’s “disappointment” with  
12           NS Power’s inventory forecasts.

13  
14   **2.4 FAM Incentive**

15  
16           Ms. Smith testifies about the FAM incentive mechanism, which NS Power has proposed  
17           to suspend during the two-year Rate Stabilization period. Ms. Smith writes:

18  
19                   The elimination of the incentive may be something of an incentive for the  
20                   Company to over forecast fuel costs, even though fuel costs and FAM  
21                   projections will be trued up at the end of the Plan period.<sup>4</sup>  
22

23           Aside from this comment, Ms. Smith does not recommend that the Board reject NS  
24           Power’s request, nor does she provide any further evidence on the topic. Her statement  
25           indicates a misunderstanding of how the FAM incentive works, and NS Power’s reasons  
26           for asking that it be suspended during the two-year period of the Rate Stabilization Plan.  
27           As NS Power explained in its response to Avon IR-23(a), we propose to suspend the  
28           incentive for the benefit of customers, not the Company.

---

<sup>4</sup> Direct Testimony of Lee Smith, August 4, 2012, page 13, lines 245-247.

REDACTED

---

1 NS Power maintains that it is appropriate, and in the interests of customers, that the  
2 Board approve its request to suspend the incentive during the two-year Rate Stabilization  
3 period.

4  
5 **2.5 Gas Storage**

6  
7 Alton has submitted evidence, which according to the testimony of its company witness  
8 is intended to,

9  
10 [...] demonstrate that its storage facility will provide increased gas supply  
11 security both for the Maritimes region as a whole, as Mr. Hopper will  
12 demonstrate. For the Halifax region, Mr. Graham will demonstrate how  
13 Alton increases operational flexibility and supply security on the Halifax  
14 lateral. In addition, Mr. Graham addresses how Alton can help stabilize  
15 NSP's system generation while NSP adds an increasing amount of  
16 intermittent renewable energy to its generation portfolio. Finally Mr. van  
17 Egteren demonstrates that Alton can be a valuable tool to help NSP  
18 achieve both natural gas price reductions and natural gas price volatility  
19 reductions.<sup>5</sup>  
20

21 In its letter of June 25, 2012 confirming its approval of Alton's request for intervenor  
22 status, the Board wrote:

23  
24 Alton's participation in this proceeding is subject to the following two  
25 conditions:

- 26 1. Alton comply with the timeline in the Board's Order of May 9, 2012, on  
27 a go-forward basis; and  
28 2. Alton will only be permitted to address issues contained in the Board's  
29 Final Issues List.

30 Accordingly, Alton will be required to respect these conditions and not  
31 raise issues outside the scope of the Final Issues List.<sup>6</sup>

32 The GRA proceeding is not the appropriate place to discuss a proposed project that could  
33 be subject to future negotiations between NS Power and Alton. NS Power is particularly

<sup>5</sup> Direct Testimony of David Birkett, August 7, 2012, page 8, lines 5-14.

<sup>6</sup> Letter from Doreen Friis (UARB) to René Gallant (NSPI), June 25, 2012.

## NS Power 2013 General Rate Application Reply Evidence

**REDACTED**

---

1           troubled that a knowledgeable industry participant with whom NS Power has had  
2           commercial discussions is speculating on the nature of our gas procurement practices.

3  
4           Alton's last proposal to NS Power indicated an in-service date of April 1, 2015.  
5           Information provided by Alton during a meeting in March 2012 further supports this in-  
6           service date. Indeed, Alton's answers to IRs confirm Alton's view that it is extremely  
7           unlikely that its project would be operational before the end of 2014.<sup>7</sup> Since the status of  
8           this project is uncertain, and since it is not expected to be in service until 2015 if it  
9           proceeds at all, there is no impact on natural gas prices for 2013 and 2014 test years.  
10          Even if Alton's evidence were otherwise valid, which it is not, the evidence is irrelevant  
11          to the revenue requirement for the two year period being considered in this application.

12  
13          Alton's evidence provides information on the potential benefits that may arise from the  
14          use of natural gas storage, but it omits items that are fundamental to determining whether  
15          natural gas storage would provide a net benefit to NS Power's customer in 2013 and  
16          2014.

17  
18          Storage costs typically include fees for:

- 19  
20          •       the capacity reserved for storage;  
21          •       the injection charge;  
22          •       the withdrawal charge;  
23          •       the fuel charge;  
24          •       cushion gas (if any);  
25          •       the carrying costs of buying gas in summer to withdraw in winter.

---

<sup>7</sup> Alton-Birkett (NSPI) IR-2.

REDACTED

---

1 Other elements of storage that can impact costs are:

- 2
- 3 • injection and withdrawal limits (or ratchets) that limit injections and withdrawals
  - 4 to a percent of stored gas;
  - 5 • the number of cycles that the storage offers;
  - 6 • any pipeline redelivery costs.
- 7

8 Typically natural gas storage requires long-term contractual commitments. These  
9 commitments entail a level of risk as they presume that the conditions making storage  
10 attractive initially will continue to exist throughout the term of the contract. Alton's  
11 testimony assumes that the price spreads underlying their calculations will continue into  
12 the future. As an example, the testimony of Jan van Egerton says:

13

14 Q: Would the \$0.49/MMbtu savings that you demonstrated in your  
15 example be greater than the cost of storage with Alton and associated  
16 carrying costs?

17 Probably not, but remember, our example is for gas bought and sold at  
18 Henry Hub. The difference in seasonal prices at Henry Hub is much less  
19 than the seasonal price differences in the New England/Maritimes market  
20 as was illustrated by Mr. Hopper in his testimony. [...] <sup>8</sup>

21

22 Alton's business case therefore relies upon a continued seasonal variance in New  
23 England pricing over and above the seasonal pricing at Henry Hub. Should the seasonal  
24 variation in New England be reduced – perhaps by a build out of additional pipeline  
25 capacity and the introduction of inexpensive Marcellus shale gas - then the business case  
26 for storage will be undermined.

27

28 NS Power will continue to assess the potential benefits to customers of natural gas  
29 storage against the associated costs and risks. NS Power remains open to continuing its  
30 discussions with Alton as their project proceeds through its regulatory and internal

1           approvals. We respectfully suggest, however, that Board involvement in or direction  
2           about potential contractual negotiations for supply services relating to fuel procurement is  
3           neither warranted nor within the jurisdiction of the Board.

REDACTED

---

1    **3 OPERATING COSTS**

2  
3    **3.1 Labour**

4  
5    **3.1.1 Actual vs. Forecast**

6  
7        Liberty has testified that there are significant gaps between forecast and actual costs for  
8        labour in the two most recent years, 2011 and 2012. NS Power disagrees with Liberty's  
9        analysis.

10  
11       NS Power's current budget and best forecast for labour costs is [REDACTED]. This  
12       forecast represents the 2012 amount included in NS Power's 2013 GRA filing. We have  
13       not produced a new 2012 budget and the budget remains as filed in the GRA.

14  
15       Liberty referred to NS Power's response to Liberty IR-54 which shows the actual costs  
16       incurred to the end of May 2012 plus the remaining budget figures for June-December.  
17       The figure included was [REDACTED]. The figure was incorrect in the response to  
18       Liberty IR-54 and it should have been [REDACTED]. The figure in NS Power's original  
19       IR erroneously omitted a portion of labour costs related to compensation at risk in the  
20       amount of \$2.5 million. NS Power has filed a revised response to IR-54 which indicates  
21       the correct figure. The difference between NS Power's current forecast for regulated  
22       labour costs of \$137.3 million and the [REDACTED] included in the revised response to  
23       IR-54 represents timing of labour costs incurred during the year.

24  
25       Simply taking the June-December budget figures and adding them to the January to May  
26       actuals leads to incorrect conclusions. NS Power labour costs are not consistent month to  
27       month. They fluctuate based on the timing of such events as power plant shutdowns. If a  
28       maintenance shutdown is moved from one month to another, the actuals in a given month  
29       may appear to reflect savings over the budget, but the savings are not real savings  
30       because a future month will reflect a corresponding increase in labour costs over the

## NS Power 2013 General Rate Application Reply Evidence

REDACTED

---

1 budget when the maintenance actually occurs. For these reasons, Liberty's conclusion  
2 that NS Power's actual labour costs in 2012 are below the amounts in the 2013 GRA  
3 filing is incorrect.

4  
5 On page 36 of its evidence, Liberty indicates that the 2012 January to May actuals plus  
6 January to December budget for actual 2012 labour costs of [REDACTED] is [REDACTED]  
7 [REDACTED] lower than 2012 Compliance (2012C) estimate of [REDACTED].  
8 In fact, as noted above, the correct amount is [REDACTED] which is [REDACTED] lower  
9 [REDACTED] than 2012C. Changes reflect NS Power's initiatives aimed at continuous  
10 improvement in our efforts to reduce costs and improve cost effectiveness. NS Power's  
11 Direct Evidence filed on May 8, 2012 discusses these initiatives to reduce costs. It would  
12 be inappropriate to use NS Power's efforts to reduce costs compared to compliance rates  
13 in a manner that unfairly penalizes the Company in future test years.

14  
15 NS Power's forecast labour costs in 2011, as filed in the 2012 GRA were \$143.7  
16 million.<sup>9</sup> Actual labour costs in 2011 were \$141.3 million. The variance of \$2.4 million  
17 is the net result of increased labour costs in certain divisions and savings in others.  
18 Labour cost increases and savings cannot be viewed in isolation. We manage labour  
19 budgets in conjunction with other operating costs. Management may determine it is more  
20 appropriate to use contractors than internal employees, which would decrease labour  
21 costs, but increase contract costs, compared to budget. Both types of costs constitute  
22 operational expenses. Part of the \$2.4 million in 2011 labour savings occurred in Power  
23 Production; however, the \$1.3 million in Power Production saved was offset by contract  
24 costs that were \$5.2 million higher than budgeted. It is more appropriate to look at total  
25 regulated operating costs for 2011, which were \$261.4 million<sup>10</sup> compared to forecast  
26 total regulated operating costs for 2011 of \$252.6 million, adjusted for reclassifications

---

<sup>9</sup> 2012 GRA DE-03-DE-04, Partially Confidential Appendix C.

<sup>10</sup> 2013 GRA DE-03-DE-04, Partially Confidential Appendix E.

REDACTED

---

1 from revenue (\$236.3 million, as filed).<sup>11</sup> NS Power's actual regulated operating costs in  
2 2011 were 3.5 percent higher than forecast in the 2012 GRA.

3  
4 On page 36 of its evidence, Liberty refers to forecast labour costs for 2011 of \$149.5  
5 million citing NS Power's response to Liberty IR-104 in P-892. Liberty's statement is  
6 not accurate. The cited figure does not reflect the total regulated labour costs NS Power  
7 provided in response to Liberty IR-104. Liberty included the non-regulated labour of  
8 \$5,250,000 on Line 41 of the Corporate Adjustments tab. These are labour related costs  
9 incurred by NS Power, are not recovered through customer rates and therefore are  
10 excluded from the revenue requirement. As discussed above, NS Power's forecast labour  
11 costs for 2011, as indicated in its response to Liberty IR-104 and set forth in the Partially  
12 Confidential 2012 GRA DE-03-DE-04 Appendix C, were \$143.7 million.

13  
14 **3.1.2 Forecast Methodology**

15  
16 At page 27 of its evidence, Liberty complains that NS Power did not provide requested  
17 information for the personnel numbers for each group for which the Company provided  
18 labour costs in Partially Confidential 2013 GRA DE-03 DE-04 Appendix E. As  
19 previously explained to Liberty during the 2012 GRA and earlier in this 2013 GRA, NS  
20 Power does not develop labour forecasts based on FTEs.

21  
22 NS Power develops its division forecasts based on total labour dollars. We prepare each  
23 division forecast starting from the preceding period's base labour cost, and then adjusting  
24 for position additions, position reductions, use of term labour, overtime influences,  
25 benefit influences, and wage adjustments for union and non-union positions. The 2013  
26 forecast began with our most current estimate of 2012 labour costs by division. We  
27 adjusted for projected staff additions and reductions, benefit changes, and salary changes.  
28 Separate estimates were applied for estimated overtime labour costs and temporary term

---

<sup>11</sup> 2012 GRA DE-03-DE-04, Partially Confidential Appendix C.

REDACTED

---

1 labour costs based on proposed work plans and evaluation of prior periods. We  
2 developed the 2014 forecast using the same approach based on the 2013 forecast. This is  
3 the best approach to forecasting labour costs year-over-year.  
4

5 **3.1.3 Full Time Equivalents (FTEs)**  
6

7 Liberty indicated it had “no basis for assessing the staffing numbers that drive estimates  
8 of 2013 and 2014 labour costs.”<sup>12</sup> NS Power did provide Liberty with information on  
9 staffing levels.<sup>13</sup> As discussed above in section 3.1.2, however, NS Power does not base  
10 labour forecasts on FTEs. In response to the information provided, Liberty indicated that  
11 the historical information provided, while not as detailed as Liberty requested, did show a  
12 drop in numbers. Liberty speculated that the increases in labour costs forecast for 2013  
13 and 2014, by contrast, appear to require a material increase in staffing. Liberty  
14 concluded that, to the extent the forecasts for 2013 and 2014 rely upon increases in  
15 staffing, the Company has so far not provided enough identification of or justification for  
16 such increases. In fact, NS Power’s Direct Evidence, and our responses to IRs provide  
17 support for the 2013 and 2014 labour costs, which are not entirely tied to increases in  
18 staffing.  
19

20 The personnel figures included in NS Power’s responses to CA IR-17 and CA IR-73  
21 demonstrate changes in staffing. Seasonality in staffing levels makes it is hard to provide  
22 a single FTE figure for each year, and at this point, we only have figures for the first half  
23 of 2012. For the sake of comparing apples to apples, we can take an average FTE for the  
24 first six months of 2010, 2011 and 2012. The figures are 1972, 1962, and 1840,  
25 respectively. The change from 2011 to 2012 reflects staff reductions that NS Power has  
26 identified in its Direct Evidence. Because FTE levels change from month to month due  
27 to timing of things such as maintenance schedules, those FTE averages do not necessarily

---

<sup>12</sup> Liberty Evidence, page 28, line 203.

<sup>13</sup> Liberty (NSPI) IR-69.

REDACTED

---

1 reflect the levels for the next six months. Such factors as power plant outage schedules  
2 may vary. Nevertheless, these averages do show the decreasing FTE trend.

3  
4 Average salary figures can be used to demonstrate changes in staffing levels in 2013 and  
5 2014. Dividing the labour costs provided in NS Power's response to Revised Liberty IR-  
6 54 by the average salary of [REDACTED], which is based on 2012 actual salaries at the time of  
7 this filing and adjusted for wage adjustments each year, yields an approximate FTE  
8 estimate for 2011, 2012, 2013 and 2014 of 1922, 1818, 1857 and 1861, respectively. As  
9 noted, NS Power does not forecast based upon FTEs, and so this example is provided for  
10 illustrative purposes only. This demonstrates the decline in FTEs from 2011 to 2012  
11 discussed in the Company's Direct Evidence. The increase in 2013 mainly results from  
12 the additional FTEs to operate the Biomass plant, while 2014 is relatively flat.

13  
14 As indicated above, increases in staffing are not the only driver of increased labour costs  
15 in 2013. The addition of 34 employees in 2013 at the Biomass plant increases FTEs.  
16 However, reductions in FTEs have occurred across the organization. Increased storm  
17 costs in 2013 are primarily due to overtime but these do not result in additional staffing  
18 positions.

19  
20 **3.1.4 Comparison of 2012F to 2013F**

21  
22 Liberty indicated that the 2013 estimate of \$144.2 million in costs is [REDACTED] or [REDACTED]  
23 [REDACTED] above what the Company expects it will spend in 2012. As noted in section 3.1.1,  
24 the current estimate for 2012 is higher than Liberty indicated in its evidence. The 2013  
25 estimate of labour costs excluding any adjustments for administrative overheads and  
26 corporate allocations is \$144.2 million. That is [REDACTED] or [REDACTED] higher than  
27 the 2012 estimate of labour costs of [REDACTED]. Figure 3-1 below breaks out the  
28 components of the increased labour costs for 2013 compared to the 2012 forecast:

REDACTED

Figure 3-1

2012F (in millions of dollars)	
Increased storm costs	3.1
Addition of Biomass labour	3.3
Reduction in labour due to Lingan	(3.0)
Increased Corporate Groups labour	0.3
Decreased Technical & Construction Services labour	(0.1)
Decreased Power Production labour	(1.6)
Decreased Customer Service labour	(0.2)
Increased Corporate Adjustments labour	0.1
<b>2013</b>	<b>144.2</b>

Note: Figures presented reflect whole numbers which may cause \$0.1M in rounding differences on some line items.

The increased labour costs in 2013 compared to 2012 forecast reflect significant changes, including storm costs, labour for the Biomass plant, staff reductions for the Lingan plant and salary adjustments. NS Power discussed all of these factors in our Direct Evidence. Liberty states that there is no justification but Figure 3-1 makes the reasons for the increase clear. Adding positions, outside of the biomass plant, is not among the reasons. Aside from salary and benefit adjustments, which we discuss in section 3.1.5, the two largest increases are due to storm costs and biomass labour, both of which are supported in the application. Other changes between 2012 forecast and 2013 include additions and reductions of positions within the divisions, savings in overtime and reductions in term labour.

Liberty indicated NS Power has a significant one-year increase in 2013 labour costs. However, excluding labour costs associated with storm costs and biomass operations, NS Power's labour costs have increased by [REDACTED], which includes the salary adjustment. This demonstrates that NS Power has reduced staffing levels and implemented savings in labour costs.

REDACTED

---

1 It is worth noting that the costs included in Figure 3-1 are gross labour costs. NS Power  
2 recovers certain costs from affiliates through Corporate Support recoveries. Increased  
3 Corporate Group costs associated with affiliate growth are fully recovered from those  
4 affiliates in accordance with the Affiliate Code of Conduct. As a result, NS Power does  
5 not seek recovery from customers through rates for any of those costs.  
6

### 7 **3.1.5 Forecast Wage Increase**

8  
9 On page 29 of its evidence, Liberty refers to the increases provided to unionized  
10 employees in the Collective Agreement from April 1, 2007, to March 31, 2012, and  
11 comments on the size of increases provided over the term of the agreement. As always in  
12 preparation for negotiations, management examined internal and external dynamics back  
13 in 2007 to determine and understand current labour issues and challenges. In 2007, the  
14 following dynamics were occurring:  
15

- 16 • NB Power had substantially increased its wages for IBEW unionized workforce  
17 as reflected in its IBEW Generation agreement dated January 2007 to December  
18 31, 2011. This collective agreement allowed for 3 percent in 2007, 5 percent in  
19 2008, 3 percent in 2009, 3 percent in 2010 and 3.5 percent in 2011. At that time,  
20 NS Power was paying below the NB Power wage rates. This agreement further  
21 widened the gap for identical roles within the IBEW union and utility industry.  
22
- 23 • The Alberta economy was strong and NS tradespersons were leaving to go out  
24 West for higher paying jobs.  
25
- 26 • Newfoundland Power raised its wage rates by 3 percent in 2007, 4 percent in  
27 2008, 3 percent in 2009, 3 percent in 2010 and 3.5 percent in 2011. Maritime  
28 Electric raised its wages by 2 percent in each of January 2007, July 2007, January  
29 2008 and July 2008. In 2009, 2010 and 2011 the increases were 3 percent, 2.5  
30 percent and 3 percent, respectively.

# NS Power 2013 General Rate Application Reply Evidence

**REDACTED**

1 In 2007, in order to gain labour stability and security, NS Power and the IBEW 1928  
2 negotiated a collective agreement that included wage increases shown in Figure 3-2:  
3

4 **Figure 3-2**

NS Power Collective Agreement Wage Increases					
2007	2008	2009	2010	2011	2012
2.5% plus \$1.50/hr rate (for some trades)	3.5%	0%	4% plus \$1/hr rate (for some trades)	4%	TBD

5 \*Note: refer to April 1 2007 to March 31, 2012 Collective Agreement for specifics. There has been no  
6 increase in 2012 and the parties are currently in negotiations.  
7

8 NS Power has prepared an analysis that compares NS Power's wage increases to those  
9 noted above for NB Power, Maritime Electric and Newfoundland Power:  
10

11 **Figure 3-3**

	2007	2008	2009	2010	2011	2012
NS Power	2.5% plus \$1.50/hr rate (for some trades)	3.5%	0%	4% plus \$1.00/hr rate (for some trade)	4%	TBD
NB Power	3%	5%	3%	3%	3.5%	4%
Maritime Electric	4%	4%	3%	2.5%	3%	3.25 %
Newfoundla nd Power	3%	4%	3%	3%	3.5%	3.25 %

12  
13 When we negotiated this 2007 to 2012 collective agreement, there was no way to know  
14 what would occur in the North American economy in 2008 and 2009. We cannot open  
15 up collective agreements during their term to make ad hoc changes. This would violate  
16 the negotiated contract. The 5 year agreement gave us low turnover rates that benefited  
17 customers by allowing us to retain highly skilled committed employees. It enabled us to  
18 attract qualified, trained applicants into apprenticeship and journey person roles. It  
19 brought labour peace that enabled key customer deliverables on reliability and  
20 renewables development.

REDACTED

---

1           **Unionized Labour Costs for 2012**

2  
3           In September 2011, a survey by CKF/Minas Basin collected wage data from  
4           organizations operating in the Atlantic Region and from organizations that had filed  
5           negotiated collective agreements with HRSDC. NS Power made the September 30, 2011  
6           Milliken Compensation Survey available in response to Liberty IR-133.

7  
8           Data collected from organizations operating in the Atlantic Region through the  
9           CKF/Minas Basin survey indicated that the average negotiated wage increase for 2012  
10          was 4.1 percent and that for 2013, it was 5.0 percent. The same analysis reported median  
11          wage increases of 4.0 percent for 2012 and 5.4 percent for 2013. Table 5 of the  
12          September 2011 Milliken report reflects this information. This report validates the 4  
13          percent increase NS Power negotiated in the 2007-2012 Collective Agreement for NS  
14          Power unionized employees for 2011 as consistent with those provided by other similar  
15          organizations in 2012, and specifically with the negotiated settlements of NB Power in  
16          2012 (4 percent), Newfoundland & Labrador Hydro in 2012 (4 percent) and, Maritime  
17          Electric in 2012 (3.25 percent) and in 2013 (4 percent).

18  
19          **Labour Cost Forecasts for 2013 and 2014**

20  
21          On page 31 its evidence, Liberty complains “the absence of meaningful response [to  
22          Liberty IR-133] means that the Company has not justified any increase, pending the  
23          provision of proper support”. Our response to Liberty IR-133 indicated that NS Power  
24          would provide this information to the Board upon request. Liberty did not ask the Board  
25          to have NS Power supply this information. The list of the reports available upon Board  
26          request included:

5 Internal Document.  
6

7 Unionized workers account for 51 percent of NS Power employees. While they achieved  
8 increases of 4 percent in 2011 under the 2007 to 2012 collective agreement, salaries for  
9 non-union employees increased by an average of 2.25 percent in 2011. Non-union  
10 salaries are projected to increase [REDACTED] in 2012. Liberty’s assumption on page 31  
11 that NS Power would incur a [REDACTED] combined increase over two years is not correct.  
12 The recommended salary increase in the November 2010 [REDACTED]

13 [REDACTED]  
14 [REDACTED]. In the 2012 GRA  
15 settlement agreement, the salary increase budget was reduced to [REDACTED], not 3  
16 percent as stated by Liberty on page 31. [REDACTED] was updated in  
17 September 2011 and the updated data continues to support a market trend of [REDACTED]  
18 [REDACTED].  
19

20 The salary increase projected in 2013 and 2014 for NS Power is [REDACTED]. The  
21 justification for this increase is outlined below.  
22

- 23 (a) Milliken HR Report – September 2011 – Highlights  
24

25 The following data represents actual and forecasted wage increases, both  
26 nationally and for the Atlantic Region, as reported by 675 organizations in the  
27 2011/2012 Mercer Planning Survey Results. When analyzing market data, it is  
28 best to focus on the 50th percentile of the marketplace, as extremes can skew the  
29 mean either up or down.

REDACTED

1 Figure 3-4 confirms that in 2011 organizations awarded increases averaging 3  
 2 percent across the board, to employees in all job categories from tradespeople to  
 3 executives. These same organizations are expected to average [REDACTED] increases  
 4 in 2012 (See Table 1 of Milliken HR Report – September 2011)  
 5

6 **Figure 3-4**

2011 & 2012 Actual and Forecasted Percentage Salary Increases (see Table 1 in September 2011 Milliken Report)						
	2011 Actual			2012 Forecast		
	50P	Mean (incl. 0)	Mean (excl. 0)	50P	Mean (incl. 0)	Mean (excl. 0)
All Employees - All Industries – Atlantic	3.0%	2.9%	2.9%	[REDACTED]		
All Employees - Utilities – National	3.0%	2.6%	2.9%	[REDACTED]		

7  
 8 This economic environment has led to some healthy wage settlements for union  
 9 employees in the Atlantic region over the past 3 years (see Table 2 of Millken HR  
 10 Report – September 2011) and in the utility sector generally across Canada (see  
 11 Table 3 of Milliken HR Report – September 2011). Similarly, according to  
 12 Mercer, non-union employees have and will continue to receive annual  
 13 adjustments in the range of 3 percent according to a survey of 675 organizations  
 14 as per Figure 3-4.  
 15

16 Figure 3-5 below provides average and median wage settlements for the Atlantic  
 17 Region – All Industries and for National Utilities based on the September 2011  
 18 Milliken Report.

**Competitive Compensation**

18

19

It is no longer just Alberta and British Columbia that are driving the competition for skilled labour and qualified professionals to work in the resource and construction

20

## NS Power 2013 General Rate Application Reply Evidence

REDACTED

---

1 sectors. Saskatchewan's and Newfoundland's resource industries now also compete  
2 actively for all types of talent - trades, engineers, project managers, financial analysts,  
3 HR professionals, middle managers, to staff large, long term infrastructure projects. A  
4 recent Statistics Canada bulletin (The Daily, July 26, 2012) indicates that average weekly  
5 earnings increased in every province in the 12 months up to May, with growth highest in  
6 Saskatchewan (up 5.4 percent) and Newfoundland and Labrador (up 5.4 percent, and  
7 exceeding the national average since December 2010). Nova Scotia had the 4<sup>th</sup> highest  
8 year over year growth in average weekly earnings by province at 4 percent.

9  
10 Page 32 of Liberty's evidence suggests a "no increase approach" to OM&G labour costs.  
11 The 2011/2012 Mercer Study reports a sharp decline in the number of companies that are  
12 freezing salaries. The number reduced from 31 percent in 2009, to 5 percent in 2010, 3  
13 percent in 2011, and just 2 percent in 2012. A "no increase approach" would be  
14 inconsistent with market trends, and would impair our ability to get and keep skilled  
15 labour to meet customer needs. Employment in Oil & Gas extraction is up 6.8 percent; in  
16 construction, up 6.3 percent. As employment rates rise, competition for skilled labour  
17 increases across the oil and gas, mining, utilities, and other sectors (Statistics Canada The  
18 Daily, July 26, 2012).

19  
20 The 2 percent increase proposed by Liberty at page 37 would not align with market  
21 information on average salaries in the region, nationally, or in our sector. In reducing our  
22 average salary increase in 2012 (from [REDACTED] to [REDACTED]), and proposing [REDACTED]  
23 [REDACTED] in 2013 and 2014 (versus the recommended market average increase of [REDACTED]  
24 [REDACTED]), we will continue to lag the 50<sup>th</sup> percentile benchmarks, but not as widely as we  
25 would with a zero or [REDACTED] salary increase. Although it is below average market  
26 values, we believe a [REDACTED] increase will allow us to continue to attract and retain a  
27 qualified and motivated workforce.

REDACTED

---

1 **3.1.6 Administrative Overhead**

2  
3 At page 32 of its evidence, Liberty contends that NS Power's Application did not provide  
4 substantial support for the forecast increase of [REDACTED], and that absent a meaningful  
5 response, the Company has not justified *any* increase, pending provision of proper  
6 supporting information. Liberty indicates a no-increase approach would produce  
7 adjustments in 2013 of \$3,921,000 to OM&G labour and \$762,000 to Administrative  
8 labour overhead credits, producing a net reduction of \$3,159,000 to labour expense.  
9 Liberty also provided figures for 2014.

10  
11 NS Power disagrees with Liberty's basis for assuming no forecasted increase. As  
12 discussed above, actual labour forecasts reflect a variety of changes in addition to a  
13 forecast salary adjustment. In its evidence, NS Power has fully supported our requested  
14 salary adjustment. Moreover, Administrative Overhead is not purely a labour charge.

15  
16 It is not possible to reduce overhead by the forecast labour adjustment rate and expect to  
17 get a realistic estimate of administrative overhead. Administrative Overhead is charged  
18 not only on labour dollars but also on contract dollars. Contract expenses are not always  
19 determined by an escalation rate but instead vary widely depending on the projects  
20 anticipated for the year.

21  
22 For the same reasons, NS Power disagrees with Liberty's approach to the projected  
23 adjustments it provides on page 34.

24  
25 **3.1.7 Fringe**

26  
27 Labour costs include fringe benefits. The fringe benefits allocation for 2013 and 2014 is  
28 set at 16.1 percent of salary, up from our historically budgeted 15 percent. Fringe benefits  
29 are **employer** costs and are calculated as a percentage of salaries. They include:

REDACTED

---

- 1 • Canadian Pension Plan (CPP)
- 2 • Employment Insurance (EI)
- 3 • Workers Compensation Benefit (WCB)
- 4 • Health Insurance
- 5 • Dental Insurance
- 6 • Life Insurance
- 7 • Accidental Death & Dismemberment Insurance
- 8 • Long Term Disability Insurance
- 9 • Employer Contributions to Pensions
- 10 • Vacation pay for term employees
- 11 • Corporate education fund for union employees
- 12 • Employer paid RRSP's for Labour Pool employees

13  
14 Several fringe benefit expenses are projected to increase in 2013 and 2014, according to  
15 the suppliers of these programs (e.g. Federal Government, Group Benefits Provider):

- 16  
17 (a) Canada Pension Plan (CPP) & Employment Insurance (EI)
- 18  
19 • CPP and EI employer rates are set by the Federal Government. In 2011,  
20 CPP was approximately 3.6 percent of salaries which was an increase of 2  
21 percent over 2010 rates. In 2012, the CPP maximum annual contribution  
22 rate increase was 4 percent and as a result the estimated fringe cost for  
23 CPP has been estimated at 3.8 percent of salaries over the next 3 years (an  
24 increase of 0.2 percent).
  - 25  
26 • EI was approx. 1.3 percent of salaries in 2011 which was a decrease of 0.2  
27 percent over 2010 rates. The increase in rates in 2012 to the annual  
28 maximum contribution of 6.7 percent results in the estimated fringe cost  
29 for EI of 1.5 percent of salaries over the next 3 years (an increase of .2%).

REDACTED

1 (b) Group Benefits (includes Health, Dental, Life, Accidental Death &  
 2 Dismemberment (ADD), Long Term Disability (LTD))

- 3
- 4 • Projected benefit rates for 2013 to 2014 were provided by Morneau based  
 5 on industry rate increases and NS Power experience for increases in  
 6 previous years. These are forecasted increase numbers.
- 7

8 **Figure 3-12**

Benefit	2012 % of Salaries	2013/14 Estimated Projected Increase	2013/14 % of Salaries
Health		6.00%	
Dental		12.50%	
Life		15.00%	
ADD		2.00%	
LTD		14.00%	

9

10 The change in fringe from 15 percent to 16.1 percent in 2013 and 2014 assumes  
 11 the increases above (totalling 1.1 percent) and no increases to the other fringe  
 12 items listed.

13

14 **3.2 Pension**

15

16 Two consultants submitted evidence on NS Power's pension costs, Jeffrey Gray, on  
 17 behalf of the Consumer Advocate (CA), and Peter Hayes on behalf of Board Counsel. In  
 18 this section, NS Power will respond to the specific comments and recommendations  
 19 made by Messrs. Hayes and Gray.

20

21 In light of the intervenor evidence, some context about NS Power's pension history may  
 22 prove helpful:

NS Power 2013 General Rate Application Reply Evidence

REDACTED

---

1 (i) NS Power's pension plan is a mature plan that was transferred to NS Power at the  
2 time of privatization through the Nova Scotia Power Privatization Act.<sup>14</sup>

3  
4 (ii) NS Power's Collective Agreement with the IBEW requires pension changes to be  
5 ratified by the union. This provision has existed in NS Power's and its  
6 predecessors' collective agreements for over 40 years.

7  
8 (iii) While Peter Hayes identified opportunities to achieve savings through the changes  
9 to pension, the most significant costs associated with pension benefits are not  
10 within NS Power's control.

11  
12 It may also be helpful to understand several historical facts about NS Power's pension  
13 benefits.

14  
15 Before 1972, two main electrical utilities served most of Nova Scotia: the Nova Scotia  
16 Power Commission (the Commission), and Nova Scotia Light and Power Company,  
17 Limited (NSL&P).

18  
19 The Province of Nova Scotia owned the Commission, which was created in 1919. By  
20 1972, the Commission had acquired all the electric utilities in Nova Scotia except  
21 NSL&P and a few small municipal utilities.

22  
23 The Commission's pension plan was the Province of Nova Scotia's Superannuation Plan.  
24 A Commission employee's pensionable service was recognized as service under the  
25 Superannuation Plan. Pension benefits were paid from the Province's Superannuation  
26 fund, and Commission employee contributions were made to that fund.

---

<sup>14</sup> *Nova Scotia Power Privatization Act*, R.S.N.S. 1992 c. 8.

REDACTED

---

1 The Commission also honored pension and retirement obligations to employees and  
2 pension recipients of several of the acquired utilities. As a result, the Commission had  
3 obligations for past service, indexing and other benefits and for pension service from the  
4 acquired utilities.

5  
6 NSL&P employees participated in the Nova Scotia Light and Power Company, Limited  
7 Employees Improved Pension Plan (the NSL&P Plan).

8  
9 In 1972 the Province “nationalized” NSL&P through the Commission’s acquisition of  
10 NSL&P. The resulting Crown Agency, Nova Scotia Power Corporation (NSPC),  
11 assumed the obligation of the NSL&P Plan.

12  
13 On April 1, 1973, eligible employees of Nova Scotia Light and Power Company, Limited  
14 became members of the Province of Nova Scotia Public Service Superannuation Plan,  
15 with all current service employee and employer contributions subsequent to that date  
16 being paid into the Superannuation Fund.

17  
18 Between 1972 and 1992, as a result of this complicated sequence of events, NSPC found  
19 itself managing several pension plans:

- 20
- 21 • Province of Nova Scotia Superannuation. This Plan provided pension benefits for  
22 credited service with the Commission and NSPC.
  - 23 • NSL&P Plan. This Plan provided benefits for credited service with NSL&P.
  - 24 • Acquired Companies Plan. This plan provided benefits for credited service with  
25 utilities previously acquired by the Commission.
- 26

27 In 1992, NSPC was reorganized as Nova Scotia Power Inc. (NS Power), a new company  
28 created through an offering of common shares to the public. One element of this  
29 privatization was the elimination of the Province’s responsibility for the pensions of

REDACTED

---

1 NSPC employees who became NS Power employees. The privatization legislation  
2 provides that:

- 3
- 4 • The Province was to transfer the portion of the Superannuation Plan's assets that  
5 were attributable to active NSPC employees to the newly-created NS Power Plan,  
6 which also assumed the obligation to pay pensions to transferred Plan members.  
7
  - 8 • NS Power was required to provide its employees and pensioners with the same  
9 level of benefits provided by the Superannuation Plan. In effect, the NS Power  
10 Plan was a carve-out of the Superannuation Plan for NSPC employees who  
11 became NS Power employees.  
12
  - 13 • Retired NSPC employees receiving Superannuation pension benefits, and former  
14 NSPC employees who had deferred their pension, were to remain in the  
15 Superannuation Plan as obligations of the Province.  
16
  - 17 • Both plans became subject to the Nova Scotia Pension Benefits Act and the  
18 federal Income Tax Act.  
19

20 The Company's collective agreement with its union requires that changes to the pension  
21 plan be ratified by the Executive of the Union. This provision, or provisions to this  
22 effect, have been contained in the collective agreements that have been in place between  
23 the Company or its predecessors and the union for over 40 years.  
24

### 25 **3.2.1 Peter Hayes' Evidence**

26  
27 Board Counsel's witness, Peter Hayes, provides a number of pension-related criticisms of  
28 the Company. He makes the following specific recommendations:

REDACTED

---

- 1 (i) the test year revenue requirement be set at a level which reflects increased  
2 employee contribution rates, and  
3  
4 (ii) the company explore changes to its plan design that result in meaningful and  
5 sustained reductions in the plan's overall cost. The changes explored should  
6 relate to removal of or reductions to:  
7  
8 • guaranteed indexing;  
9 • subsidized early retirement;  
10 • the "best average 4 years" guarantee; and  
11 • the benefit accrual rate and bridge benefit.  
12

13 Mr. Hayes also suggested securing executive pensions, freezing or holding the line on  
14 salary increases for a limited time, and altering the governance structure.  
15

16 NS Power's response to the specific items raised by Mr. Hayes is below.  
17

18 **Governance:**  
19

20 Mr. Hayes has stated that NS Power's Board cannot change the pension plans over which  
21 it has "ultimate responsibility" without the consent of Emera's Audit Committee. NS  
22 Power disagrees. NS Power's Board of Directors has ultimate responsibility for the  
23 oversight, management and administration of the pension plans sponsored by NS Power.  
24

25 Specifically, the Emera Pension Oversight Framework states:  
26

27 Ultimate responsibility for the oversight, management and administration  
28 of the two pension plans sponsored by NSPI lies with the Board of  
29 Directors of NSPI. That Board has delegated its responsibility as  
30 Administrator of the plans to the Management Pension Committee, which  
31 is comprised of managers and officers selected by the President and Chief

## NS Power 2013 General Rate Application Reply Evidence

REDACTED

---

1 Executive Officer of NSPI. NSPI has agreed at all times at least one  
2 officer or manager of each of Emera Inc. and Bangor Hydro Electric will  
3 be a member of the Management Pension Committee of NSPI.

4 The Board of Emera Inc. has delegated its pension oversight  
5 responsibilities to the Emera Audit Committee, which is comprised of  
6 Directors approved by the Board of Directors of Emera Inc.<sup>15</sup>

7  
8 The Emera Pension Oversight Framework includes the following provision with respect  
9 to its oversight of the pension plans sponsored by NS Power:

10  
11 Whenever NSPI proposes an amendment to either of the pension plans  
12 that may have a material effect on the liabilities of either pension plan,  
13 NSPI will provide relevant supporting reports or documentation to the  
14 Audit Committee of Emera Inc., so as to enable both the Audit Committee  
15 and the Board of Directors of Emera Inc. to provide recommendations to  
16 the Board of Directors of NSPI before any decision is made on any such  
17 amendments.<sup>16</sup>

18  
19 Emera's Pension Oversight Framework provides that Emera will oversee financial  
20 aspects of both pension plans, similar to any other major financial obligation, as well as  
21 considering in advance any amendments to the pension plans which may have a material  
22 financial effect. However it does not provide Emera with decision making ability with  
23 respect to the NS Power registered pension plans.

24  
25 NS Power's Pension Governance Framework states that one of the responsibilities of the  
26 Board of Directors is to provide annual reports to the Board of Directors or other  
27 designated Board or Committee of Emera and to consult with Emera on any material  
28 amendments or changes to the pension plans. NS Power's Pension Governance  
29 Framework does not require Emera's consent.

---

<sup>15</sup> Eckler (NSPI) IR-13 Attachment, pages 115-116.

<sup>16</sup> Eckler (NSPI) IR-13 Attachment, page 116.

REDACTED

---

1           **Composition of Management Pension Committee**

2  
3           Mr. Hayes stated that operational responsibility for the pension plans is delegated by NS  
4           Power's Board to a committee dominated by Emera and Bangor Hydro Electric  
5           employees. NS Power disagrees.

6  
7           As at May 30, 2010, as noted in the Pension Governance Framework, the Management  
8           Pension Committee consisted of eight voting members. The President and Chief  
9           Executive Officer of NS Power appoints all members of the committee. As of May 30,  
10          2010, 5 of 8 voting committee members were NS Power employees. The committee  
11          currently includes four members who represent NS Power, one member who represents  
12          Bangor Hydro, and two members who represent Emera.

13  
14          During 2011, several committee members took on new roles within the Emera group of  
15          companies, but remained on the committee due to their experience with the registered  
16          plans. Retaining them on the committee also provides consistency since they had been  
17          involved in the Asset Liability Study carried out during their terms.

18  
19          Appendix C sets forth the composition of, and changes to, the Committee from 2010 to  
20          the present.

21  
22          The Committee continues to review its composition. It should be noted that other NS  
23          Power participants regularly attend committee meetings on a non-voting basis.

24          Regular invitees include:

- 25  
26          •       Vice President & Treasurer Emera Inc. (NS Power & Emera representation)
- 27          •       Director Pension Investments NS Power (NS Power & Emera representation)
- 28          •       Senior Analyst Pension Investments NS Power (NS Power & Emera  
29                  representation)
- 30          •       Human Resources Program Integration Emera Inc.(Emera representation)

## NS Power 2013 General Rate Application Reply Evidence

REDACTED

---

- 1           •       General Manager Human Resources NS Power (NS Power representation)
- 2           •       Human Resources Administrator Bangor Hydro (Bangor Hydro representation)
- 3           •       Director Human Resources & Safety Bangor Hydro (Bangor Hydro
- 4           representation)
- 5

6           NS Power has agreed that at least one officer or manager from each of Emera Inc. and

7           Bangor Hydro Electric will serve as members of the committee. The committee has

8           responsibility for more than the NS Power Defined Benefit Pension Plans. Bangor Hydro

9           Electric sponsors a separate employee pension plan, for which the committee retains

10          responsibility. The Committee also oversees the Defined Contribution Pension Plans.

11          There are some members of the NS Power Pension Plans who are employed by Emera

12          and subsidiaries of Emera other than NS Power.

13

### 14          **Focus on Assets**

15

16          Mr. Hayes said the Company has acted prudently in managing its pension assets, but that

17          there is an almost obsessive focus on the asset side of the pension equation. He believes

18          the committee devotes an inordinate amount of reporting and management time to the

19          performance of plan assets. Mr. Hayes says that in doing so, the Company appears to

20          completely miss, or at least largely ignore, the growth in obligations resulting from

21          declining interest rates, plan generosity, and the consequences of plan maturity.<sup>17</sup> NS

22          Power disagrees with this assertion.

23

24          Mr. Hayes cites a line from the Statement of Investment Beliefs, to the effect that

25          “Improving the funded status will need to come primarily from asset returns,” as

26          evidence that pension asset managers ignore the risk of declining interest rates. This is

27          neither fair nor accurate. Asserting that improvements in the plan’s funded status will

28          need to come primarily from asset returns implies that asset returns will need to be the

---

<sup>17</sup> Direct Testimony of Peter Hayes, August 7, 2012, pages 9, line 21 to page 10, line 2.

## NS Power 2013 General Rate Application Reply Evidence

REDACTED

---

1        *main*, but by no means the *only*, driver of improvement. Nothing in the Statement of  
2        Investment Belief implies that the risk of declining interest rates was or is ignored. NS  
3        Power is aware that declining interest rates can degrade funded status. We gave careful  
4        consideration to this reality during the Asset Liability Study. The current asset mix,  
5        which includes 35 pension liability hedging assets, was developed in light of several  
6        variables, including interest rate decreases, and their potential impact on of the health and  
7        sustainability of the plan, including its funded status.

8  
9        The Asset Liability Study gave careful consideration to an asset mix that would best  
10        achieve an improvement in the health of the plan, while considering the financial and risk  
11        tolerances.

12  
13        Given the current funded status of the plans, investing a larger proportion of plan assets  
14        in investments that move in a manner similar to interest rates can be expected to cause a  
15        reduction in equity holdings, and provide lower overall plan returns. The Asset Liability  
16        Study considered the impact that a larger allocation to fixed income would have on both  
17        future contributions and pension expense given the current funded status. The study  
18        concluded moving to a larger allocation in fixed income was unsustainable at present for  
19        this very reason.

20  
21        NS Power believes a 65 percent allocation to equities over the long term can be expected  
22        to provide returns that will help improve the plans' funded status. The Statement of  
23        Investment Beliefs provides that, over the long-term, as the plans become better funded,  
24        the asset mix will gradually shift to an increased amount fixed income investments.

25  
26        For illustration purposes, the Acquired II plan's post Asset Liability Management asset  
27        mix holds 80 percent in fixed income, because fund managers concluded it should have a  
28        greater proportion of liability hedging investments in light of its current funded status.

## NS Power 2013 General Rate Application Reply Evidence

**REDACTED**

---

1 In addition, an important result of the Asset Liability study has been the decision to  
2 enhance reporting to both the Management Pension Committee and the Audit Committee  
3 of the NS Power Board of Directors. NS Power and Towers Watson are currently  
4 developing a proposed framework for reporting that increases emphasis on, among other  
5 metrics, the relationship between assets and liabilities.

6  
7 NS Power's pension consultant, Morneau Shepell, provides monthly updates on  
8 accounting discount rates and the impact on pension expense. The consultant also  
9 monitors changes in solvency interest rates and financial markets. In the event of  
10 significant changes in the financial markets, our consultant provides us with an updated  
11 forecast of company contributions to the pension plan for the upcoming year.  
12 Throughout the year, this information flows to senior financial and human resources  
13 leaders in NS Power and Emera, as part of their functional business roles. They, in turn,  
14 raise this information for discussion at Management Pension Committee meetings. In  
15 addition, as requested by the IBEW, we share this information with the union's Executive  
16 Board on an annual basis.

17  
18 In IR-1 to Mr. Hayes, NS Power asked Mr. Hayes to clarify his recommendation for a  
19 more "holistic" approach to plan management. Mr. Hayes did not use the terms "funding  
20 policy" and "benefits policy" in his direct evidence, so we thank him for clarifying his  
21 interpretation of holistic plan management as including not only investment policy but  
22 also funding and benefit policy.

23  
24 As Mr. Hayes has correctly stated in his response to IR-1,

25  
26 [...] both the public service and teachers' pension plans in Nova Scotia  
27 have modified their benefit structure to substantially mitigate the risk of  
28 inflation on pensions in the post-retirement by either eliminating indexing,  
29 or by making it contingent on the plan's funded position.<sup>18</sup>

---

<sup>18</sup> Hayes (NSPI) IR-1.

## NS Power 2013 General Rate Application Reply Evidence

REDACTED

---

1 The two pension plans he cites are exempt from the Nova Scotia Pension Benefits Act  
2 (“PBA”). This enables them to change not only future accruals, but also previously  
3 accrued benefits including pensions currently being paid. In effect, the change affected  
4 all active members, former members, and pensioners for all service.

5  
6 Defined benefit pension plans sponsored by a single employer and registered under the  
7 PBA, such as NS Power’s pension plan, are prohibited from changing previously accrued  
8 benefits like indexing, as described by Mr. Hayes. In fact, the PBA would permit no  
9 change to pension benefits earned prior to the date of any change in the plan’s terms, and  
10 for greater certainty, no changes would be permitted to existing pensioners. In effect, for  
11 NS Power, such changes could only affect benefits accruing from the future service of  
12 active members. What the PBA allows NS Power’s pension plan to do would have  
13 significantly less impact than what government allowed the public service pension plans  
14 to do.

15  
16 While changing the benefit for future service would reduce current service costs (the cost  
17 of benefits being earned in respect of the current year of employment), it would not  
18 change the magnitude of the existing pension shortfall. It would not have a material  
19 impact on the total pension expense, or the cash funding requirement. This does not  
20 mean that NS Power is not considering changes to plan benefits, but rather is setting  
21 realistic expectations on the potential monetary impact of such changes.

22  
23 As such, given the limited ability to impact accrued benefits, and the requirement to  
24 negotiate benefit changes in respect of union members during collective bargaining, NS  
25 Power has no formal “benefits policy.” Instead, we continually monitor and review the  
26 competitiveness and costs associated with providing such pension benefits, and we  
27 consider whether changes to pension benefit should form part of our negotiations with the  
28 IBEW.

REDACTED

---

1 Working within the constraints set by the PBA, the collective agreement, the desire to  
2 hire and retain highly qualified employees and accounting standards, we believe that the  
3 Company does effectively manage its pension cost.

4  
5 **Employee Engagement**

6  
7 Mr. Hayes has indicated that NS Power's governance structure fails to seek input from, or  
8 engage its employees in any way. This is inaccurate. NS Power has an Employee  
9 Advisory Group for benefits that includes both union and non-union members. We  
10 established this group at the request of employees. NS Power also provides regular  
11 pension information to the members of the Pension Plan including:

- 12
- 13 • An annual letter to active members (sent as part of the annual pension statement)  
14 with information on plan performance, company and employee contributions in  
15 the most recent year, general commentary on the state of defined benefit pension  
16 plans, and updates on government provided pensions and savings plans  
17
  - 18 • Information on the member's entitlement under various scenarios, the Plan's  
19 going concern funded status, a summary of Plan terms, and contact details for  
20 additional pension information  
21
  - 22 • An annual meeting with the IBEW Executive Board to review Pension Plan  
23 financial status and to address any questions or concerns about the Pension Plan  
24
  - 25 • Retirement planning sessions, including a discussion of Pension Plan terms and  
26 benefits  
27
  - 28 • Annual total compensation statements that include pension information  
29
  - 30 • Information about the Pension Plan is available internally to employees

## NS Power 2013 General Rate Application Reply Evidence

**REDACTED**

---

1 This information, which we provide on a voluntary basis, exceeds the typical information  
2 contained in the annual pension statements required under pension legislation.

3  
4 In addition, in 2012, as part of management's annual meeting with all employees of the  
5 Company ("Employee Road Shows"), President Rob Bennett discussed the issues facing  
6 the Pension Plan and the need to balance the plan benefits and funding in a regulated  
7 utility environment.

8  
9 NS Power has demonstrated that we will establish employee advisory committees upon  
10 request from employees. We established the Employee Group Benefits Committee  
11 consisting of an equal number of union and non-union employees. The committee meets  
12 two or three times a year to review the Group Benefits provided by the Company. In  
13 2009, this committee reviewed our benefits providers and oversaw the RFP process and  
14 resulting recommendations to change the provider from Manulife to Medavie Blue Cross.

15  
16 NS Power engages all members through a number of communications throughout the  
17 year. In addition, we provide a toll free number to all employees to respond to pension  
18 plan issues, and we remind employees of this contact number each year in the annual  
19 pension statement. The toll free number is operated by our pension consultants to ensure  
20 confidentiality and expertise.

21  
22 We also note that union leaders are the elected representatives of the union members and  
23 are plan members themselves. NS Power provides the union leaders with unobstructed  
24 access to the Plan's actuary to discuss plan issues and finances. The union leaders are  
25 jointly responsible with NS Power to share pension plan information they receive from  
26 the actuary with their members.

27  
28 NS Power makes significant effort to engage its employees on issues related to pension.  
29 The facts do not support Mr. Hayes' criticism, and NS Power respectfully requests that it  
30 be rejected.

REDACTED

---

1           **Cost Mitigation**

2  
3           Mr. Hayes has recommended that the test year revenue requirement be set at a level  
4           which excludes the cash cost of approximately \$800,000 for letters of credit, whose “sole  
5           purpose is to secure executive pensions in the event that the company is insolvent, which  
6           is arguably unnecessary in the context of a regulated utility.” For clarification, the cost of  
7           \$800,000 covers a letter of credit to secure pensions that exceed the Income Tax Act  
8           maximums, and does include part of the pension amounts provided to some executives. It  
9           is important to note that of the \$800,000, \$400,000 is for the actual letter of credit, and  
10          \$400,000 is deposited with the Canada Revenue Agency (CRA) as a refundable tax. Mr.  
11          Hayes confirms this cost on page 21 of his evidence by confirming that half of the cost  
12          relates to a refundable tax remitted to CRA. This could be viewed as partially pre-  
13          funding of the Supplemental Executive Retirement Plan (SERP). The remittance of the  
14          refundable tax is an Income Tax Act requirement for SERPs that purchase a letter of  
15          credit or are pre-funded.

16  
17          NS Power decided to use a letter of credit to secure these benefits in order to provide  
18          security to members because NS Power is not formally pre-funding the SERP. At the  
19          time the SERP was established in 2002, NS Power concluded that pre-funding the SERP  
20          would not be tax effective since 50 percent of the pre-funding would have to be remitted  
21          to the Canada Revenue Agency as a refundable tax (and would not earn interest); the cash  
22          which would otherwise be used to pre-fund the SERP would be more efficiently used on  
23          activities that better serve customers. This was confirmed by another review undertaken  
24          about 5 years ago.

25  
26          Mr. Hayes has suggested that it is not appropriate for a regulated entity to secure its  
27          SERP through a letter of credit. NS Power disagrees. As security is provided to members  
28          in the registered pension plan through pre-funding, it is also reasonable to provide some  
29          level of security to members in the SERP, in our case, through a letter of credit. While  
30          we do not expect our business to fail, we have all seen failures of businesses that were

REDACTED

---

1 once considered too large to fail. Recent well known examples include Lehman  
2 Brothers, Arthur Anderson, Enron, Nortel, Washington Mutual Bank, and Worldcom.  
3 Regulated utilities are not immune from failure. In 2001, California's Pacific Gas and  
4 Electricity entered US Chapter 11 bankruptcy, re-emerging in 2004 after a settlement  
5 with creditors.

6  
7 It is not uncommon for SERPs to be secured or pre-funded. Based on a 2008 Towers  
8 Perrin study, 52 percent of Canadian SERPs are pre-funded or secured through a letter of  
9 credit. The trend in the 7 year period up to 2008 saw an increase in the percentage of  
10 SERPs that are pre-funded or secured through a letter of credit (33 percent in 2001, and  
11 40 percent in 2005 according to Morneau Sobeco surveys).

12  
13 **Salary Increases**

14  
15 Mr. Hayes has recommended considering the compounding effect that wage increases  
16 have on pension funding costs as a result of the solvency test.

17  
18 In determining the solvency position and required solvency funding, all salary history up  
19 to the valuation date is taken into account but future salary increases are not considered.  
20 At the time of the next valuation, the solvency position takes into account the increases in  
21 salary since the prior solvency valuation. As the Pension Plan provides a benefit based  
22 on the best 4-year average earnings, any salary increase impacts the full amount of the  
23 active member solvency obligation. Note that future salary increases are taken into  
24 account for going concern valuations and accounting valuations.

25  
26 NS Power is aware of the impact of salary increases on pension expense, and on both  
27 going concern and solvency funding requirements. As part of the preparation for  
28 collective bargaining, NS Power reviewed both the impact on pension expense and cash  
29 funding requirements (going concern and solvency) of various potential wage settlement  
30 rates and factored these impacts into the bargaining mandate options.

REDACTED

---

1 To put the impact on solvency funding into perspective, if we assume that on average  
2 employees have been receiving 3 percent annual salary increases. The impact of freezing  
3 all salaries for one year is equal to about 0.75 percent of the active solvency obligation or  
4 about \$2.4 million (0.75 percent of \$322 million of active member solvency obligations  
5 at December 31, 2011). Generally speaking, solvency shortfalls can be funded over 5  
6 years, so the reduction in cash contribution relative to the status quo for the next 5 years  
7 would be about \$0.5 million.

8  
9 If salaries are frozen for more than one year, there is a compounding effect on the  
10 solvency contribution requirement. For example, using the same average 3 percent salary  
11 increase assumption, and salaries are frozen for two years, the overall impact is a total  
12 2.25 percent reduction in active solvency obligations relative to the status quo. The  
13 reduction in cash contribution relative to the status quo for the next five years would be  
14 about \$1.5 million.

15  
16 While the potential savings is not immaterial, freezing salaries or reducing salary  
17 increases needs to be considered relative to the overall goal of being a median employer  
18 for total compensation. This is important so that NS Power remains competitive to be  
19 able to hire and retain qualified individuals with the right skill sets to serve our  
20 customers.

21  
22 The impact on annual pension expense would be smaller than the amounts shown since  
23 any actuarial gains are amortized over nine years. The approximate reduction in pension  
24 expense for a two year salary freeze is about \$1.1 million.

25  
26 **Plan Changes**

27  
28 On page 2, Mr. Hayes has alleged a lack of willingness to engage unionized employees in  
29 meaningful discussion around reform of the plan. However, he notes on page 33

[REDACTED] [REDACTED]  
[REDACTED]  
[REDACTED] The Company has indeed engaged unionized employees – both in past negotiations and in current negotiations, and therefore Mr. Hayes’ comments are unfounded.

The Company believes that all bargaining discussions should remain confidential and stay at the bargaining table until an agreement is reached. To negotiate in public would not be in the best interest of the customers, employees or the company. The current Collective Agreement expired on March 31, 2012. Negotiations began in March and reached an impasse in July. Following Department of Labour and Advanced Education regulations, the Company has filed for conciliation which is to occur in September.

The Union has shared the Company’s opening proposal on pension benefits to its membership when impasse was reached in negotiations in search for a strike vote to bring to conciliation to demonstrate their opposition to the Company’s opening offer. The Company’s proposal included:

- 4
- 5 • [REDACTED]
- 6

7 Mr. Hayes indicates that NS Power has seen its costs increase and has been warned that  
8 the cost increases have become a significant issue in the context of its operations, yet  
9 appears to have done little to mitigate these rising costs. NS Power disagrees with Mr.  
10 Hayes' statements.

11  
12 We are taking steps to control the costs of the pension plan that are within our control, as  
13 demonstrated by our bargaining position presented to the union. As NS Power has no  
14 control over interest rates and discount rates, we are making changes to the asset mix of  
15 the pension plan to mitigate some of the challenges of the economy and fund  
16 performances.

### 17

### 18 **3.2.2 Jeffrey Gray's Evidence**

19

20 As noted above, the other witness to submit evidence on NS Power's pension was Jeffrey  
21 Gray on behalf of the Consumer Advocate. Mr. Gray has recommended that NS Power  
22 "build a long term vision of plan design that is cost competitive, and competitive from a  
23 benefit level perspective, that is acceptable to ratepayers".<sup>19</sup>

24  
25 A number of issues raised by Mr. Gray suggest he does not understand the details of NS  
26 Power's pension plan. As a result, he has made a number of incorrect conclusions which  
27 require correction. NS Power has outlined these items below.

---

<sup>19</sup> Direct Testimony of Jeffrey E. Gray, August 7, 2012, page 14, lines 15-17.

REDACTED

---

1       **Pension Accrual Rate**

2  
3       On page 2, Mr. Gray has indicated that the lifetime defined benefit formula in the NS  
4       Power pension plan for employees with 15 years or more of service is a *full 2.0 percent*  
5       of the best average earnings for each year of service. Mr. Gray confirmed that this was  
6       his understanding in his response to NS Power's IR-2. The lifetime pension formula for  
7       all members is actually 1.3 percent of best average earnings up to the average Year's  
8       Maximum Pensionable Earnings ("YMPE") plus 2.0 percent of the excess of best average  
9       earnings over the average YMPE, multiplied by years of Credited Service (up to a  
10       maximum of 35 years). The misunderstanding of the benefit formula overstates the value  
11       of the plan benefits and likely impacts Mr. Gray's analysis presented on pages 5, 6 and 7  
12       of his evidence.

13  
14       The relevant excerpts from the December 31, 2010 actuarial valuation report, as  
15       referenced by Mr. Gray in his response to NS Power IR-2, are reproduced below for  
16       reference:

17  
18       •       **Definitions**

19               **Credited Service** is the years credited for pension purposes and is limited  
20               to 35 years. For benefit purposes, Credited Service is split into two  
21               different types:

22  
23               •       *Original Plan Credited Service:*

- 24                       •       For a Member who joined the Plan prior to July 1, 2004: Credited  
25                       Service accrued prior to July 1, 2004 for Union members, and  
26                       Credited Service accrued prior to October 1, 2004 for Non-Union  
27                       members  
28                       •       For members who joined the Plan on or after July 1, 2004, Original  
29                       Plan Credited Service is zero.

REDACTED

---

- 1           •     *Revised Plan Credited Service:*

- 2                     •     Equal to Credited Service less Original Plan Credited Service.

3  
4           •     **Pension Payable**

5           For a member who retires from active service after his or her unreduced  
6           retirement age, the annual pension is as follows, subject to the Income Tax Act  
7           maximum pension rules with regard to service after January 1, 1992:

- 8  
9           •     *Amount of Pension Payable Prior to Age 65:*

- 10                   (a)    If the Member (1) has Original Plan Credited Service, or (2) has no  
11                            Original Plan Credited Service but has completed 15 years of  
12                            Continuous Service:

13  
14                                    2 percent of the member's Final Average Earnings, multiplied by  
15                                    the member's years of Credited Service.

- 16  
17                   (b)    If the Member has no Original Plan Credited Service and has not  
18                            completed 15 years of Continuous Service:

19  
20                                    1.3 percent of the member's Final Average Earnings up to the  
21                                    Average YMPE, plus 2 percent of the member's Final Average  
22                                    Earnings in excess of the Average YMPE, the total multiplied by  
23                                    Credited Service.

- 24  
25           •     *Amount of Pension Payable After Age 65:*

26           The sum of the following:

- 27                   (a)    2 percent of the member's Final Average Earnings, multiplied by  
28                            the member's years of Credited Service prior to January 1, 1966;  
29                            plus

REDACTED

---

1 (b) 1.3 percent of the member's Final Average Earnings up to the  
2 Average YMPE, plus 2 percent of the member's Final Average  
3 Earnings in excess of the Average YMPE, the total multiplied by  
4 Credited Service after December 31, 1965.  
5

6 The lifetime pension formula for all members is 1.3 percent of best average earnings up  
7 to the average Year's Maximum Pensionable Earnings ("YMPE") plus 2.0 percent of the  
8 excess of best average earnings over the average YMPE, multiplied by years of Credited  
9 Service (up to a maximum of 35 years).  
10

11 For a member who retires from active service, in addition to the lifetime pension benefit,  
12 the member is entitled to a bridge benefit payable to age 65 equal to 0.7 percent of best  
13 average earnings up to the average YMPE for each year of Credited Service if either a)  
14 the member joined the Plan prior to July 1, 2004 or b) the member joined the Plan after  
15 July 1, 2004 and has completed 15 years of Continuous Service.  
16

17 **Early Retirement Reduction**  
18

19 Mr. Gray indicates on page 3 that the adjustment for early retirement is 0.5 percent if the  
20 pension starts prior to age 65. We would like to clarify that the reduction is 0.5 percent  
21 for each month that the member's age at retirement precedes their *unreduced* retirement  
22 age. The unreduced retirement age may vary by member based on their service, age at  
23 termination, and date of hire and may be prior to age 65.  
24

25 **35 Years of Service Cap**  
26

27 One page 3, Mr. Gray indicates that employees do not contribute to the pension plan once  
28 they have completed 35 years of service. It is important to also note that employees do  
29 not accrue additional credited service under the pension plan after they have accrued 35

REDACTED

---

1 years of service. As they are not accruing additional service, no additional contributions  
2 are required.

3  
4 **Relative Ranking of NS Power Defined Benefit pension plan in the Private Sector**

5  
6 On page 5, Mr. Gray indicates that NS Power's pension plan is "very generous" and  
7 "atypical" from a private sector perspective. However, for new hires, based on  
8 benchmarking studies with other Defined Benefit plans in the same sector (utilities, and  
9 oil and gas), the DB provision of the NS Power pension plan is [REDACTED] in terms of  
10 the net overall Company provided value. Please refer to Eckler IR-26.

11  
12 **Long Service Award**

13  
14 On page 7, Mr. Gray states that the Long Service Award ("LSA") contributes to the  
15 overall value of the benefit payable from the defined benefit pension plan. The LSA is  
16 not a benefit payable from the defined benefit pension plan. In Mr. Gray's response to  
17 NS Power IR-3, he confirmed that he included the value of the LSA in his analysis on the  
18 registered pension plan. The incorrect attribution of the LSA as a benefit payable from  
19 the plan, along with the misunderstanding of the plan's lifetime pension formula (the  
20 Pension Accrual Rate) results in an overstatement of the value of the plan and impacts his  
21 analysis regarding the generosity of the plan presented on pages 5 and 7.

22  
23 The LSA is a separate benefit plan that pays out a lump sum to members who retire with  
24 an unreduced pension. The LSA mirrored a benefit provided by the provincial  
25 government at the time of privatization. Effective July 2007, NS Power closed the LSA  
26 plan to new hires.

REDACTED

---

1           **Asset Smoothing - Solvency Financial Position**

2  
3           On page 9, Mr. Gray stated that the asset smoothing reserve *increased* the stated asset  
4           level for the December 31, 2010 solvency financial position. We would like to clarify  
5           that the asset smoothing reserve *decreased* the actuarial value of the assets at December  
6           31, 2010.

7  
8           **Difference between Going Concern and Solvency**

9  
10          On page 9 of his Direct Testimony, Mr. Gray has indicated that the “difference in results  
11          is primarily the inclusion of an asset smoothing reserve in the solvency number which  
12          increases the stated asset value by \$27 million.” The difference between the going  
13          concern and solvency financial position is not simply due to the inclusion of the asset  
14          smoothing reserve. In fact, the same asset smoothing reserve is used to determine the  
15          going concern and solvency financial positions. The main difference is that the going  
16          concern and solvency valuations use different actuarial assumptions and methods to  
17          determine the respective obligations.

18  
19          On page 9, lines 24 to 29 of his evidence, Mr. Gray suggests that the difference in  
20          solvency and going concern liabilities as at December 31, 2009 is due to the asset  
21          smoothing reserve. We would like to clarify that the asset smoothing reserve only  
22          impacts the reported assets, the asset smoothing reserve does not impact the reported  
23          liabilities.

24  
25          **Required Payments on Plan Wind-up – Grow In Benefits**

26  
27          On page 10, Mr. Gray indicates that grow-in benefits are only required to be funded if the  
28          plan had sufficient assets. We would like to clarify that this was true up to April 30,  
29          2007. In 2007, the NS government passed Bill 4 which changed the wind-up funding  
30          requirements. Effective May 1, 2007, Nova Scotia Pension Benefits Act Section 80(1A)

REDACTED

---

1 requires that on plan wind-up the plan sponsor is responsible for funding the full amount  
2 of any wind-up shortfall including grow-in benefits. While certain types of plans are  
3 exempted from this requirement, the NS Power plan is not exempted.

4  
5 **Asset Mix**

6  
7 Mr. Gray indicates on page 11 of his testimony that the asset mix for the Plan is  
8 transitioning to an 80 percent fixed income (and 20 percent equity). The target asset mix  
9 for the Plan is 65 percent equity and 35 percent fixed income. We believe that the  
10 reference to the 80 percent fixed income mix relates to the target mix for Part II of the  
11 Acquired Companies Pension Plan.

12  
13 **December 31, 2010 Financial Position References**

14  
15 We have reproduced Mr. Gray's comments from lines 12 to 26 on page 8 of his evidence  
16 below and have added our comments in <bold within chevrons> for clarification.

17  
18 The December 31, 2010 valuation reflects a going concern unfunded  
19 liability of \$144 million. < **This figure includes asset smoothing**> This  
20 shortfall has grown to \$185 million <**This figure excludes asset**  
21 **smoothing**> as at the end of 2011 per various press releases – this amount  
22 is amortized over a period of years and our understanding is this  
23 prescribed annual amount required to fund this shortfall is the concern of  
24 ratepayers. <**While the going concern unfunded liability and cash**  
25 **contributions are relevant, we believe that it is the pension expense on**  
26 **an accounting basis that is the primary concern since this is what**  
27 **primarily impacts the rates**> Where a private sector organization has a  
28 defined benefit plan and benefit costs escalate rapidly with probability of  
29 ongoing high or volatile costs, the need to be price competitive forces  
30 organizations to review all input costs and make changes if necessary. The

REDACTED

---

1 annual solvency payment for 2010 <**This reference should be to 2011**>  
2 was approximately \$26 million which would be in addition to the  
3 approximate \$9 million for current service costs for a total of \$35 million.  
4 By press release (which are not always very exact in their definition of  
5 pension funding numbers given accounting, ongoing, solvency, and wind-  
6 up valuation numbers) the total pension funding expense appears to have  
7 increased to \$58.6 million. <**We believe the \$58.6 million is a reference**  
8 **to projected pension expense for 2013 which is not directly**  
9 **comparable to the cash funding figure of \$35 million shown above. As**  
10 **previously noted by NS Power in their submissions, the term “pension**  
11 **expense” refers not only to the accounting expense related to the main**  
12 **pension plan – it refers to the accounting expense related to all**  
13 **pension and post-employment benefit plans.>**

14  
15 While NS Power does not take issue with Mr. Grays’s suggestion to look for long term  
16 opportunities to achieve savings in pension costs (which NS Power is doing as described  
17 in further detail in its response to Mr. Hayes’ evidence above), Mr. Gray’s conclusions  
18 about the overall comparative value of the NS Power plan is based upon his own  
19 incorrect assumptions and conclusions about the plan and therefore we respectfully  
20 request that these findings be rejected.

### 21 22 **3.3 Executive Compensation**

23  
24 Board Counsel’s consultant, Liberty reviewed NS Power’s executive compensation costs.  
25 No other intervenor submitted evidence on this issue.

26  
27 NS Power provided full access to Liberty respecting the details of its executive  
28 compensation in order for it to perform its review. Liberty’s evidence concludes that:

REDACTED

---

- 1 1. NS Power's approach to benchmarking is consistent with common elements of
- 2 benchmarking performed by outside firms and is commensurate with public utility
- 3 needs;
- 4 2. That NS Power's executive compensation is appropriate;
- 5 3. That NS Power should consider comparative group design for benchmarking.
- 6

7 NS Power's executive compensation costs are appropriate. NS Power's Management  
8 Resources Compensation and Corporate Responsibility (MRCC) committee and its Board  
9 of Directors continually review benchmarking information to ensure that NS Power's  
10 executives are compensated appropriately. It has and will continue to look for  
11 opportunities to refine and improve upon its comparator information. NS Power will  
12 continue to provide annual reports to the Board on this issue.

#### 14 **3.4 Vegetation Management and Storm Costs**

15  
16 NS Power has requested approval of \$3.4 million for an enhanced Vegetation  
17 Management program to improve reliability for our customers. The \$3.4 million will  
18 specifically address off right-of-way hazard trees, which in high winds can fall (from  
19 outside the right-of-way) into our lines, causing outages. These trees are not addressed  
20 through our current right-of-way based management programs. NS Power has requested  
21 this same amount in both the 2009 and 2012 GRAs for the off-right-off way part of the  
22 reliability plan. Through the negotiated settlements for 2009 and 2012, it was agreed that  
23 NS Power would not then undertake such an additional program. The need to proceed  
24 with this program however has not diminished. Indeed, as time progresses, the risk of  
25 hazard resulting from these trees falling into our power lines increases.

26  
27 Additionally, NS Power requested approval for storm costs in rates to be updated to  
28 reflect the most recent five-year average, representing an increase of \$5.5 million.

REDACTED

---

1 Two intervenors have filed evidence on these issues. Liberty, on behalf of Board  
2 Counsel has, as it did last year, confirmed their support for the increased spending  
3 requested for vegetation management. However, Liberty's evidence is that NS Power  
4 should not be permitted the increase in storm restoration costs because it believes that NS  
5 Power should see savings in the test years associated with the increased vegetation  
6 management amount. Lee Smith on behalf of the Small Business Advocate, on the other  
7 hand, raises no issue with respect to storm restoration costs, but says the increase in  
8 vegetation management spending should not be approved. Ms. Smith wrongly believes  
9 the increased spending request for vegetation management is for \$4.5 million. As noted  
10 above, the requested increase is \$3.4 million.

11  
12 Both Board Counsel, through Liberty, and the SBA took similar positions in the 2012  
13 GRA.

14  
15 **Response to Liberty Evidence on Storm Response**

16  
17 While Liberty recognizes the importance of the Board's approval of the increased  
18 spending of \$3.4 million to commence the off-right-of-way tree program, it continues to  
19 misunderstand the relationship between this program and NS Power's actual experience  
20 with storm costs. NS Power makes the following comments:

- 21
- 22 • Liberty's primary justification for recommending the denial of the additional \$5.5  
23 million in storm response costs is that it believes that increased vegetation  
24 management should reduce storm response costs. While we do expect reliability  
25 to improve from the off right of way vegetation management program, the  
26 average amount of tree contact outages we experience during severe weather is  
27 insignificant in comparison to the volume of tree exposure across our distribution  
28 system. Tree contacts continue to be our biggest cause of outages, due to the  
29 tremendous exposure of our distribution system to trees across the province. Our  
30 current vegetation management program is helping, and our proposed off-right-of-

## NS Power 2013 General Rate Application Reply Evidence

REDACTED

---

1 way program would help even more. But this won't equate to a direct trade-off  
2 with storm expenses, because, as mentioned, the exposure is so widespread.  
3 Liberty's concept would only work if storms hit precisely where we conducted  
4 tree trimming each year. That simply doesn't happen.

- 5
- 6 • The off right of way vegetation management program is a 7 year program<sup>20</sup> and  
7 projects long-term, incremental reliability improvements and associated storm  
8 response savings. The program does not claim to eliminate storm tree contact  
9 outages, but targets 2009 reliability levels as an acceptable average for storm tree  
10 contact outages. NS Power notes that 2009 storm costs were \$7.7 million (\$2.7  
11 million over the current amount in rates).
  
  - 12
  - 13 • Liberty refers to "increases...occurring over time," and "one should expect  
14 gradual, but material improvements in outage numbers and duration."<sup>21</sup> The prior  
15 approved increases were for our standard, ROW-based vegetation management.  
16 While we do expect and have demonstrated reliability improvements as a result,  
17 these funds are not directed at severe weather outages as is the requested \$3.4  
18 million for off-right-of-way vegetation management. As a result, the gradual  
19 reductions in storm response costs Liberty references would have negligible  
20 contribution associated with the approved prior increases associated with our  
21 existing vegetation management program.
  
  - 22
  - 23 • Liberty testifies that NS Power should be using median weather data to forecast  
24 storm expenses as opposed to mean data. Using the median is not appropriate  
25 considering the type of distribution that storm costs represent. Storm costs  
26 evaluated over time show a skewed distribution (as opposed to normally  
27 distributed, flat, or some other type) with no real maximum amount for storm

---

<sup>20</sup> NSPI (Liberty) IR-60.

<sup>21</sup> Liberty Evidence, August 7, 2012, page 41, lines 14-20.

## NS Power 2013 General Rate Application Reply Evidence

REDACTED

---

1 costs. Additionally, there is significant variability from one year to the next.  
2 Using a median would exclude the very real impact of outlier years that are  
3 significantly costlier than a median year; using a mean is more representative of  
4 average costs. Given the variability of severe weather, which Liberty  
5 acknowledges<sup>22</sup>, the lack of any extreme values in the data set used, and the  
6 inherent purpose of the storm response budget, the use of the median is  
7 statistically inappropriate in this scenario.  
8

- 9 • “Re-invest savings in reliability” – this statement from Liberty IR-60 (f) both last  
10 year and this year prompted an argument from Liberty. NS Power provided full  
11 response to this issue in its 2012 GRA Reply Evidence and repeats many of these  
12 points below. The reduction in Customer Hours of Interruption (CHI) has  
13 changed from the 2012 GRA, but the estimate of “at most \$400,000” in savings  
14 still stands. This is based on comparing the 2009 storm costs (\$7.7 million) to the  
15 requested \$10.5 million, and dividing by the 7 year time frame that it will take to  
16 implement the program.  
17
- 18 • Storm costs for 2011 were lower, largely due to reduced significant weather  
19 events. There are other years in the storm increase calculation presented in  
20 Liberty IR-64 Attachment 1 that are similar to 2011 costs, with costs being largely  
21 a function of storm severity.  
22
- 23 • The statement that NS Power uses resources in ascending order of cost depending  
24 on the degree of need is true – we use internal crews for lesser storms, local  
25 contractor crews for larger storms, and out-of-province crews for even larger  
26 events. However, this statement is relevant only in the context where increased  
27 vegetation management investments reduce storm response effort. This will not  
28 be the case over the term of the test years presented.

---

<sup>22</sup> Liberty Evidence, August 7, 2012, page 41, line 20.

## NS Power 2013 General Rate Application Reply Evidence

### REDACTED

---

- 1           •     Liberty has proposed a very simplistic method for evaluating storm cost  
2           reductions. There are two basic factors that Liberty has overlooked, the first of  
3           which is that we do not currently have an off right-of-way tree program. Because  
4           this has not been done yet, any new program would take several years before  
5           reductions would be realized; we are only presenting information over two test  
6           years, not over the life span of the vegetation management program. In addition,  
7           this fails to consider the chaotic nature of storms.  
8
- 9           •     NS Power currently spends significantly more than is in rates for storm response;  
10          even assuming that we will save money as a result of the investment, it would  
11          need to be at least a one-for-one return on that investment in the first year, a  
12          highly unrealistic assumption. The program will take years to implement, and for  
13          benefit to be observed. There will be an increase in reliability, but this is a long-  
14          term initiative that will take time to implement. It has been demonstrated that  
15          Nova Scotia is increasingly at risk for hurricanes and other severe weather, so the  
16          best information we have is that these costs will continue.  
17
- 18          •     NS Power's storm response is based upon the guidelines of the Emergency  
19          Services Storm Restoration Plan (ESRP), which informs the degree of response  
20          that we make to significant weather events. NS Power's ESRP is filed and  
21          reviewed by the Board annually arising from its decision in in the Storm Outage  
22          Review proceeding from 2005<sup>23</sup>. A significant portion of the costs associated  
23          with a severe storm response is related to mobilization and demobilization costs  
24          that are incurred as a result of activating crews proactively. We do not wait for a  
25          storm to hit before deploying crews, but rather stage them where we estimate the  
26          storm damage will occur. We would only make changes to that response after  
27          having seen demonstrated reductions in storm damage over several events. We

---

<sup>23</sup> Public Review of the Power Outages resulting from the Storm of November 13 and 14, 2004; NSUARB-NSPI-P-401.32.

REDACTED

---

1 have no evidence that storm costs would be reduced during the test years as a  
2 result of the increase vegetation management spend.

3  
4 NS Power's evidence shows that its actual experience with storm costs has well-  
5 exceeded the amount approved in rates for the last several years. NS Power  
6 requests that the Board reject Liberty's recommendation to not approve NS  
7 Power's request for increased spending to recover costs for storm restoration.

8  
9 **Response to Lee Smith on Vegetation Management**

10  
11 The essence of Ms. Smith's evidence in support of her recommendation against  
12 improving reliability through increased spending for off right of way vegetation  
13 management is that there are likely less trees that pose problems as a result of recent  
14 years' experience with severe weather:

15  
16 The Company posits that severe weather events increase risk of tree  
17 failure. This may be true for trees that remain standing. However, it  
18 seems possible if not likely that a high number of trees that fell from  
19 outside of right-of-ways just two years ago, leaving fewer trees standing  
20 that may be problems.<sup>24</sup>

21  
22 Ms. Smith's opinion on this issue is unsupported by any factual evidence or analysis but  
23 merely reflects Ms. Smith's own musing about what 'seems possible'.

24  
25 At page 7 of Ms. Smith's evidence, she comments upon NS Power's response to Liberty  
26 IR-59. Ms. Smith has misunderstood this evidence. Liberty IR-59 shows the regular,  
27 right of way based vegetation management programs return a \$/ACHI of 34, overall. The  
28 calculations that are detailed in Liberty IR-60 for the off-ROW program are based on data  
29 that is independent of the data used to calculate the routine vegetation management  
30 savings.

---

<sup>24</sup> Direct Testimony of Lee Smith, August 4, 2012, page 7, lines 110-112.

REDACTED

---

1  
2 Ms. Smith states “there is no basis to assume that if spending about \$9 million on  
3 vegetation management costs \$34 per ACHI, spending 45 percent more will produce the  
4 same benefit per dollar if additional spending.”<sup>25</sup> This is not what NS Power is proposing  
5 or suggesting. Ms. Smith is comparing apples to oranges.  
6

7 The current vegetation management program spend that is referred to in NS Power’s  
8 response to Liberty IR-59 is the Net Present Value (NPV) of distribution, reliability-  
9 based vegetation management. The requested \$3.4 million increase (as noted above, not  
10 \$4.5 million as characterized in Ms. Smith’s testimony) is for a completely separate,  
11 alternative program to target off-ROW danger trees. We calculate that the requested \$3.4  
12 million for off-ROW vegetation management will return a NPV \$/ACHI of 17.4.  
13

14 With respect to reliability measures, Ms. Smith points to the SAIFI / SAIDI / CAIDI  
15 measures as indicating that the investment in vegetation management has not improved  
16 reliability. What she does not consider is that our response to storms significantly  
17 changed after the weather started to get worse, thus maintaining those reliability  
18 measures is increasingly challenging. NS Power has shown that the occurrence of hours  
19 of high wind gusts has been increasing. Our evidence is that there is a strong correlation  
20 between occurrences of high hours of wind gusts >90 km/h and poor reliability (see  
21 Liberty IR-62 Attachment 1, Figure 15 and Conclusion).  
22

23 In essence, Ms. Smith’s conclusions contradict themselves. She agrees that successive  
24 weather events increase the risk of tree failure (line 143) for trees that remain standing.  
25 However she then goes on to state that “ it seems likely that the high number of trees that  
26 fell from outside of right-of-ways just two years ago will have resulted in natural tree  
27 trimming, leaving fewer standing trees that may be problems.”<sup>26</sup> The number of trees  
28 that caused the Customer Hours of Interruption (CHIs) during storms from 2003 to 2011

---

<sup>25</sup> Direct Testimony of Lee Smith, August 4, 2012, pages 8-9, lines 142-146.

<sup>26</sup> Direct Testimony of Lee Smith, August 4, 2012, pages 8-9, lines 143-146.

REDACTED

---

1 is minimal. The average storm tree contact CHIs that we are targeting with the off ROW  
2 vegetation management program were caused by an average of less than 1,500 events.  
3 Even assuming multiple trees per event, this still represents less than 0.5 percent of the  
4 estimated amount of total tree exposure on our distribution system, and that does not  
5 consider new growth for increased exposure.  
6

7 Furthermore, Ms. Smith suggests that that NS Power has “done no analysis of the number  
8 of kilometers that were impact (sic) by these outside of right-of-way trees in 2010.”<sup>27</sup>  
9 This is untrue. In NS Power’s response to Liberty IR-60(b), we state that analysis of  
10 danger tree work to date indicates that, on average, 17.5 percent of distribution spans  
11 require danger tree management. This continues to be the case as long as the forested  
12 edge exists along our distribution system. Anything to the contrary would require  
13 complete forests to fall and cease growing. Clearly, the minimal quantity of fallen trees  
14 during severe weather events is not eliminating our forests, and therefore the exposure to  
15 off ROW tree contacts remains.  
16

17 NS Power submits that there is no merit to Ms. Smith’s speculative evidence on this  
18 topic. NS Power requests that the Board resist Ms. Smith’s recommendation and  
19 reiterates its request for approval of this important component of vegetation management  
20 spending to improve reliability for customers.  
21

### 22 **3.5 Bad Debt Expense**

23  
24 David Effron, on behalf of the Consumer Advocate, has calculated bad debt expense  
25 using a simple average for the years 2009 to 2011 and suggests NS Power’s estimate is  
26 overstated. He proposes a revenue requirement adjustment of \$1.2 million.

27 NS Power has calculated bad debt expense using a forecast that incorporates prior results  
28 as well as current trends, rate increase sensitivities and other information. Mr. Effron’s

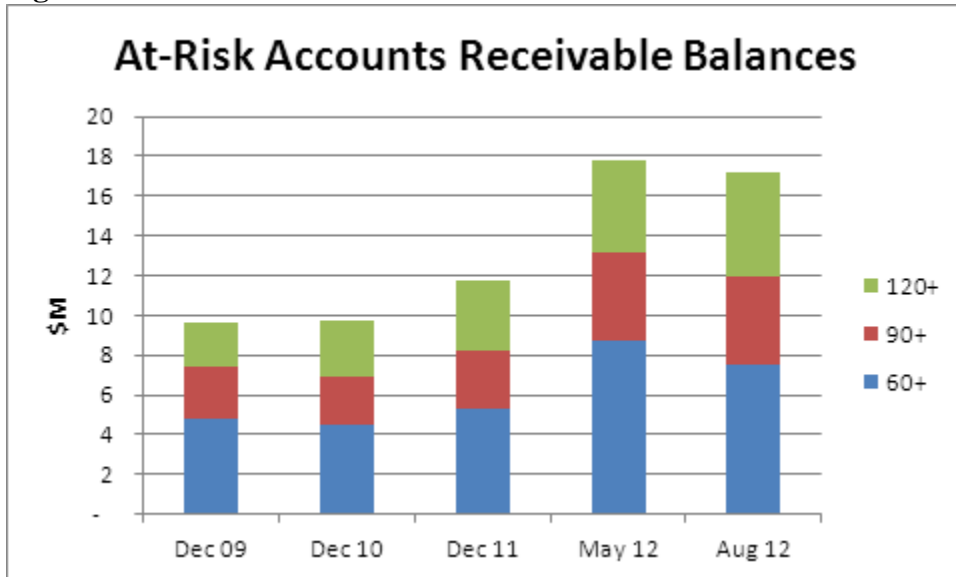

---

<sup>27</sup> Direct Testimony of Lee Smith, August 4, 2012, page 9, lines 146-149.

REDACTED

1 analysis only examined the historical average of net bad debt expense. This ignores the  
2 current economic trends that our customers are facing. A very strong indicator of the  
3 write-off amount is the age of the receivable; the older the receivable, the greater the  
4 likelihood that it will not be paid and will ultimately be written off. The graph below  
5 isolates the key “at-risk” receivables balances. Figure 3-13 demonstrates that our  
6 receivables balances that are at-risk have increased significantly since 2011, and indicate  
7 the need for a greater increase in the allowance associated with net bad debt expense than  
8 a simple mathematical exercise to look at historical averages.  
9

10 **Figure 3-13**

11  
12  
13 NS Power has undertaken a number of initiatives to attempt to address the increase with  
14 at risk receivables, including:

- 15 • Initiation of a three-tier, third-party collection strategy late in 2011
  - 16 • Increased focus of internal efforts on working at-risk accounts
- 17  
18

REDACTED

---

- 1           •       Modification of current processes around individual bills to intervene before  
2                   balances become unmanageable, thus increasing the likelihood of payment  
3

4           The 2013 and 2014 net bad debt amounts were calculated assuming that the total number  
5           of defaults in those years remains comparable to the 2011 experience, and the average  
6           amount of each default increases by the same amount as the rate increase. Concurrently,  
7           the amounts recovered from accounts that had been written off and the associated  
8           commissions paid were increased to reflect the increased third-party collection process  
9           that was initiated late in 2011.  
10

11          NS Power maintains that the forecast for net bad debt reflected in the test year forecast is  
12          the best estimate and developed based on reasonable assumptions.  
13

### 14   **3.6 Workforce Reduction**

15  
16          As noted in NS Power's Application and IR responses, NS Power undertook a workforce  
17          reduction in 2012 as a cost saving measure. David Effron argues that savings achieved in  
18          2012 should be transferred to 2013 for the determination of new rates, thus ignoring the  
19          test year forecast approach.  
20

21          The test year is the creation of a forecast for a specific period. Mr. Effron has transferred  
22          savings from the prior period to the test year, suggesting savings should be derived. His  
23          claim is that the savings derived in 2012 are not in "rates". NS Power maintains that it  
24          anticipates earning within its allowed rate of return in 2012 and therefore recovery of  
25          costs from customers is accomplished. The 2013 labour costs reflect the continuing  
26          benefits of changes in 2012, as well as other impacts forecast for 2013. To impute the  
27          actual 2012 savings into 2013 on top of those matters would be an exercise in double  
28          counting, and as well would amount to retroactive ratemaking.

**NS Power 2013 General Rate Application Reply Evidence**

**REDACTED**

---

1 Mr. Effron further suggests that income taxes be derived differently related to the  
2 workforce reduction. The Company has followed its Board approved accounting policy  
3 with respect to the tax treatment of the workforce reduction costs. No adjustment is  
4 required.

5

6 NS Power requests that the Board reject these recommendations.

REDACTED

---

1    **4   FINANCE**

2  
3    **4.1   Rate Base**

4  
5    **4.1.1   Allowance for Materials and Supplies**

6  
7           Board Counsel Consultant, Donna Ramas, states that the methodology used to calculate  
8           the average regulated rate base for the allowance for materials and supplies is not correct.

9           Ms. Ramas states:

10  
11                   The allowance for materials and supplies included in the 2013 and 2014  
12                   average rate base balances in the revenue requirement calculations are not  
13                   reflective of the projected 2013 and 2014 average balances. The average  
14                   regulated rate base should be reduced by \$5.8 million in 2013 to reflect the  
15                   projected average 2012 materials and supplies balance. The average  
16                   regulated rate base should be increased by \$2.1 million in 2014 to reflect  
17                   the projected average 2014 materials and supplies balance.<sup>28</sup>  
18

19           Ms. Ramas stated the same issue in the 2012 GRA and has indicated that although NS  
20           Power has used this method for calculating the Materials and Supplies balance  
21           incorporated in rate base for several past rate cases does not mean that the methodology  
22           is reasonable or the correct approach to use in setting rates.

23  
24           Consistent with last year, NS Power's rates are set using a return on rate base  
25           methodology, which has been consistently used in the past and approved by the Board.  
26           The Board has approved NS Power's methodology to calculate the average rate base for  
27           material and supplies as well as Cash Working Capital (CWC). NS Power has followed  
28           this methodology since the Board approved the Company's rate base in 2006. Both  
29           allowance for materials and supplies and allowance for working capital use an average  
30           within the appropriate periods to calculate the averages. This has been consistently used  
31           in the past and approved by the Board. It is inappropriate to change methodologies to

---

<sup>28</sup> Direct Evidence of Donna Ramas, CPA, August 7, 2012, page 3, lines 60-66.

REDACTED

---

1 calculating average rate base on a specific line item. As noted by Ms. Ramas, changing  
2 the methodology results in an increase to average regulated rate base in 2014 and a  
3 decrease to average regulated rate base in 2013. NS Power requests that the Board deny  
4 this request.

5  
6 Ms. Ramas' recommendations are not consistent with Board-approved methodology, and  
7 do not have the impact of improving the net revenue requirement over the two test  
8 years. NS Power requests that the Board reject Ms. Ramas' recommendations.

9  
10 **4.1.2 Working Capital**

11  
12 Ms. Ramas has suggested that the methodology used by NS Power to calculate the  
13 average regulated rate base for allowance for working capital is not correct. Ms. Ramas  
14 states that the amount of allowance for working capital included in the 2013 and 2014  
15 average rate base balances in the revenue requirement calculations are not reflective of  
16 the projected 2013 and 2014 working capital needs. In future cases, if the allowance for  
17 working capital request is not voluntarily reduced by NS Power as it has proposed in this  
18 case, then the amount of allowance for working capital included in the average test period  
19 rate base should be based on the amount calculated specific to the test period and not on a  
20 two-year average basis. Ms. Ramas has noted that the impact if NS Power had not  
21 applied the settlement adjustment would be a decrease to average regulated rate base in  
22 2013 of \$6.9 million and an increase in 2014 of \$11.1 million.

23  
24 The average regulated rate base for 2013 includes the average of the 2012F and 2013 test  
25 year allowance for working capital in calculating the average. 2012F is not based on a  
26 lead-lag approach, which is the methodology used for test years, and the approach Ms.  
27 Ramas refers to in her evidence. It is not appropriate to deduct the adjustment from  
28 actuals. The adjustment was a settlement on the lead lag approach and not actual  
29 working capital. As noted above, NS Power's rates are set using a return on rate base  
30 methodology, which has been consistently used in the past and approved by the Board. It

## NS Power 2013 General Rate Application Reply Evidence

**REDACTED**

---

1 is inappropriate to change methodologies to calculating average rate base on a specific  
2 line item. As noted by Ms. Ramas, changing the methodology results in an increase to  
3 average regulated rate base in 2014 and a decrease to average regulated rate base in 2013.  
4 As NS Power adjusted the allowance for working capital in 2013 and 2014, this  
5 recommendation has no impact on the 2013 and 2014 test years. NS Power requests that  
6 the Board deny this request.

7  
8 Ms. Ramas states that methodology used by NS Power in the 2013 test year does not  
9 limit the cash working capital allowance included in rate base to \$27.9 million as  
10 indicated by NS Power in DE-03 -DE-04 and if NS Power's intention was, in fact, to  
11 limit the working capital allowance to the 2012 GRA Settlement Agreement level of  
12 \$27.9 million, the average regulated rate base for 2013 needs to be reduced by \$15.4  
13 million. NS Power requests the Board deny this request.

14  
15 NS Power indicated it applied an adjustment factor to the 2013 and 2014 forecasts to  
16 retain the cash working capital allowance at the 2012 GRA settlement level of \$27.9  
17 million. NS Power agrees the \$27.9 million adjustment was not applied to 2012F,  
18 however this was the intention as 2012F is calculated on a different basis than 2013 and  
19 2014. The allowance for working capital in 2012 was based on actual working capital  
20 and not a lead lag approach, which is how the allowance for working capital is  
21 determined for the 2013 and 2014 test years. 2012F represents NS Power's 2012 budget  
22 and is not a test year. NS Power limited the allowance for working capital to \$27.9  
23 million in the 2013 and 2014 test years, which is consistent with the 2012C test year.

24  
25 NS Power submits that it has calculated working capital appropriately and has reduced  
26 revenue requirement to the benefit of customers through the adjustment made. NS Power  
27 requests that the Board reject Ms. Ramas' recommendations.

REDACTED

---

1 **4.1.3 Plant In Service**

2  
3 David Effron, consultant to the Consumer Advocate suggests that NS Power over-  
4 forecasts capital expenditure in setting rates, which overstates rate base and therefore  
5 overstates revenue requirement. He proposes a revenue requirement adjustment of \$4.9  
6 million. NS Power disagrees with Mr. Effron's recommendation.

7  
8 Mr. Effron's assertion is based on incorrect conclusions. NS Power's response to UARB  
9 IR-35 provided a historical summary of actual versus amounts set in rates for property  
10 plant and equipment (PP&E). For each of the last five years, the actual invested PP&E  
11 has been higher than the amount set in rates, reinforcing that NS Power does not overstate  
12 its rate base.

13  
14 Figure 4-1 has been re-produced below for reference.

15  
16 **Figure 4-1**

Year	Actual (\$M)	Amounts in Rates (\$M)	Variance (\$M)
2007	2,384.9	2,368.3	16.6
2008	2,422.9	2,368.3	54.6
2009	2,573.7	2,478.6	95.1
2010	3,006.4	2,478.6	527.8
2011	3,107.1	2,478.6	628.5

17  
18 For 2012 the forecasted average rate base provided in RB2-16 is higher than what is  
19 provided in the 2012C filing, further demonstrating that NS Power's rate base in 2012 is  
20 expected to be higher than the amount used to set 2012 rates. Adjustments to one line  
21 item are not appropriate without updating other line items that may have opposite effect  
22 adjustments to revenue requirement and as demonstrated by the table above, customer  
23 rates have consistently reflected less investment than the Company has had to make to  
24 provide service.

REDACTED

---

1 Mr. Effron states that NS Power has underspent in the first half of 2012 and therefore this  
2 should reduce the forecast of plant additions in 2012 for purposes of determining the  
3 2013 test year average rate base. However, this year-to-date variance is largely a timing  
4 difference. During both the 2009 and 2012 GRAs, Mr. Effron made these same  
5 assertions. The Board should not arbitrarily reduce NS Power's annual capital spending  
6 based on partial year results as the timing of the capital expense can change throughout  
7 the year.

8  
9 In addition, the forecast for setting rates is a test year that ultimately will have pluses and  
10 minuses. It is improper to adjust one item without a review and update of other items in  
11 the test year forecast.

12  
13 Furthermore, capital expenditures reflect a dynamic program. Projects get deferred or  
14 cancelled while new projects are identified and substituted. The test year forecast is a  
15 snapshot of one point in time.

#### 17 **4.1.4 Capital Expenditure Management**

18  
19 Ms. Smith, on behalf of the Small Business Advocate testifies that it appears that NS  
20 Power has not managed capital expenditure costs effectively. She makes no specific  
21 recommendations.

22  
23 NS Power is a cost-effective, well-run company. Independent audits have repeatedly  
24 confirmed this assessment. This is especially true during the current period of  
25 transformation as we adapt to the loss of pulp and paper load and change from a system  
26 based on imported high-carbon intensity fuels to one based more on clean, local,  
27 renewable energy sources. In response to evolving environmental regulations that focus  
28 on coal, we have made changes in the way we operate our legacy thermal plants, and  
29 reduced staffing levels – all with a view to reducing costs and further improving our cost  
30 effectiveness.

REDACTED

---

1 Capital expenditures reflect a dynamic program. Projects get deferred or cancelled while  
2 new projects are identified and substituted. The test year forecast is a snapshot of one  
3 point in time. Planned investments are rigorously reviewed and assessed by NS Power as  
4 well as stakeholders and ultimately approved by the Board.

5  
6 **4.1.5 Deferred income taxes – FCR and FAM**

7  
8 Mr. Effron also provides testimony with respect to Deferred Taxes on Fixed Cost  
9 Recovery (FCR) and Fuel Adjustment Mechanism (FAM) be adjusted. He recommends  
10 a net effect reduction of \$0.1 million to the revenue requirement.

11  
12 NS Power has prepared each forecast test year consistent with the approach used in prior  
13 years. This involves a true-up of balance sheet items for the forecast preceding the test  
14 year. This will result in more timely and accurate beginning balance sheet values for the  
15 test year. No separate adjustment is required to the test year.

16  
17 Mr. Effron further suggests that the deferred tax amounts should be netted with the FAM  
18 and FCR balances before calculating interest, though does not propose any adjustment  
19 with respect to this issue. NS Power's evidence remains as referenced in its response to  
20 CA IR-65. Deferred taxes represent a non-cash asset or liability. The interest is intended  
21 to compensate for the financing of cash items. The deferred charge reflects a cash asset.  
22 Furthermore, the deferred tax position reverses and reflects only timing differences. The  
23 outcome of Mr. Effron's proposed treatment would be a lower FAM and FCR interest  
24 recovery and resulting increase to the revenue requirement.

25  
26 **4.1.6 Allowance for Funds Used During Construction (AFUDC)**

27  
28 Mr. Effron applies information from NS Power's response to Larkin IR-25 related to  
29 Construction Work in Progress (CWIP) to calculate Allowance for Funds Used During

REDACTED

---

1 Construction (AFUDC). This ignores how the AFUDC calculation for the test year is  
2 computed. The proposed net reduction in revenue requirement is \$4.2 million.

3  
4 NS Power computes AFUDC within its capital management system, PowerPlant. It  
5 calculates AFUDC on an individual project level rather than an aggregate CWIP balance.  
6 This is consistent with the approach used to develop depreciation expense. This is further  
7 consistent with how NS Power has computed AFUDC in the 2012 GRA and in earlier  
8 GRAs. This is the most accurate way to compute AFUDC on a project by project basis.

9  
10 Mr. Effron's calculations are further flawed as the monthly CWIP balances contain  
11 AFUDC and the proposed calculations are further compounding interest monthly and  
12 separately semi-annually. NS Power compounds interest for AFUDC on a semi-annual  
13 basis only in accordance with its Board approved accounting policy.

14  
15 NS Power maintains that computing AFUDC within PowerPlant at the project level is  
16 appropriate and there is no adjustment required to the revenue requirement.

17  
18 **4.1.7 Deferred Tax Charges**

19  
20 Similar to the adjustments proposed for work force reductions, Mr. Effron is proposing a  
21 number of adjustments that transfer savings from prior periods to the test year. The  
22 proposed adjustments for Section 21 total \$28.1 million. Mr. Effron has completely  
23 overlooked the value created by the Section 21 flexible amortizations in managing rates  
24 for customers. Mr. Effron has made similar arguments related to the Section 21  
25 regulatory asset in the 2012 and 2009 GRA processes. Mr. Effron also confuses the fact  
26 that customers have already received the benefit of these tax amendments in prior years  
27 as NS Power did not earn outside of its approved earnings band in recording these  
28 benefits. NS Power was also able to avoid seeking a rate increase in certain years by  
29 utilizing the carryover mechanism through Section 21 that allowed NS Power the ability

REDACTED

---

1 to avoid rate increases by utilizing the mechanism and therefore passing the benefits of  
2 these amendments back to customers.

3  
4 Mr. Effron has ignored the general principles of the test year. The test year is the  
5 creation of a forecast for a specific period. Mr. Effron has transferred savings from the  
6 prior periods to the test year, suggesting savings should be derived. His claim is that the  
7 savings derived in 2011 and other years are not in “rates”. NS Power maintains that this  
8 is retroactive rate making and violates basic regulatory concepts. There is no condition to  
9 arbitrarily shift savings from one year to the next. In addition, as noted above, Mr. Effron  
10 has failed to acknowledge that NS Power was able to avoid rate increases in those years  
11 due to these benefits and the availability of the Section 21 carryover mechanism.

12  
13 NS Power has included in the test year forecast the amortization expense as previously  
14 approved by the Board. The Board directed that recovery would commence in 2007 over  
15 an eight year amortization period. NS Power reached settlement with stakeholders on its  
16 calculation methodology used for regulated ROE. The agreement gives NS Power  
17 flexibility in amortizing the Section 21 regulated asset, allowing the Company to  
18 recognize additional amortization amounts in the current period, reducing amounts in  
19 future periods. This has provided rate stability for customers. The Board approved the  
20 agreement. As part of the 2012 GRA Settlement Agreement, the Board approved a  
21 continuation of the agreement to allow NS Power flexibility in using the regulatory asset.

22  
23 Mr. Effron has confused two separate tax items. The 2011 tax deduction for routine  
24 capital projects has nothing to do with the Section 21 tax regulatory asset. To include  
25 this as a reduction to the Section 21 asset is incorrect. Similarly, the incremental 2007  
26 income tax refund and M&P tax credit should not be deducted from the Section 21 tax  
27 regulatory asset. The Section 21 tax regulatory asset reflects amounts pre-2003 and relate  
28 to a specific tax ruling regarding the treatment of capitalized interest. The proposed  
29 adjustments reflect retroactive rate making and violate the regulatory principles of a test  
30 year.

**NS Power 2013 General Rate Application Reply Evidence**

**REDACTED**

---

1 Mr. Effron argues “inequitable” treatment with the 2011 tax deduction for routine capital  
2 projects. NS Power earned within its allowed rate of return in 2011, suggesting  
3 appropriate recovery of costs by customers and full equity balance between customers  
4 and the Company.

5  
6 The claim that Section 21 is completely recovered by the end of 2012 is therefore false  
7 and ignores basic regulatory principles as well as previously approved Board Orders.

REDACTED

---

1    **5    CAPITAL STRUCTURE /RETURN ON EQUITY**

2  
3           Two consultants have submitted evidence respecting NS Power’s Capital Structure and/or  
4           Return on Equity, Laurence Booth, on behalf of Board Counsel, and Lee Smith, on behalf  
5           of the SBA. Ms. Smith admits she is not an expert on cost of capital matters. NS Power  
6           refers to and relies upon the evidence of its experts, Kathleen McShane and Jim Coyne  
7           provided in Appendices D and E.

8  
9           In the 2012 GRA decision, the UARB set rates based upon a 9.2 percent return on equity  
10          and 37.5 percent common equity. NS Power has asked the Board to maintain the 9.2  
11          percent return for rate setting purposes and its common equity ratio of 37.5 percent, even  
12          though the evidence of Kathleen McShane filed on May 8 confirmed that these  
13          percentages were below industry benchmarks for a utility of comparable risk to NS  
14          Power.

15  
16          At page 1 of his evidence, Dr. Booth states, “I regard NSPI’s current common equity  
17          ratio of 37.5% for rate setting purposes to be reasonable.”<sup>29</sup>

18  
19          Further, he states:

20  
21                   NSPI is asking for the continuation of a 9.2% return on equity (ROE) on a  
22                   37.5% common equity. I regard this as marginally excessive, but would  
23                   note that it is not hugely out of line with similar awards elsewhere and that  
24                   NSPI has refrained from asking for clearly excessive financial metrics.<sup>30</sup>

25  
26          Despite finding that NS Power has “refrained from asking for clearly excessive financial  
27          metrics” and that what NS Power has sought is “not hugely out of line with similar  
28          awards elsewhere”, he goes on to recommend reducing NS Power’s return for rate setting  
29          purposes to 7.5 percent in 2013 and 8.5 percent in 2014.

---

<sup>29</sup> Evidence of Laurence D. Booth, August 2012, page 1, lines 5-6.

<sup>30</sup> Evidence of Laurence D. Booth, August 2012, page 3, lines 17-20.

**NS Power 2013 General Rate Application Reply Evidence**

**REDACTED**

---

1           Lee Smith recommends reducing NS Power's reasonable range for earnings to a band of  
2           9.1 percent to 9.3 percent.

3  
4           The reply evidence of Ms. McShane and Mr. Coyne provide clear support for NS  
5           Power's requested capital structure and refute the conclusions of Dr. Booth and Ms.  
6           Smith. NS Power adopts the evidence of Ms. McShane and Mr. Coyne and requests that  
7           the Board reject the recommendations of Dr. Booth and Ms. Smith.

REDACTED

---

1 **6 REVENUE, COSS AND RATES**

2  
3 Intervenor evidence on cost of service related matters was submitted by Mel Whalen on  
4 behalf of Board Counsel, and Lee Smith on behalf of the Small Business Advocate. In  
5 addition, Halifax Regional Municipality (HRM) and the Union of Nova Scotia  
6 Municipalities (UNSM) have submitted evidence specific to issues related to Streetlight  
7 ratemaking. In this section, NS Power provides its response to specific items raised by  
8 these parties.

9  
10 Aside from the response provided below, NS Power notes that with respect to Mr.  
11 Whalen's suggested wording addition to the Interruptible Rider, we are in agreement with  
12 the proposed change.

13  
14 **6.1 Revenue to Cost Ratios of Small Business Customer Classes**

15  
16 Ms. Smith, on behalf of the Small Business Advocate, states that under the NS Power  
17 proposed revenue to cost (R/C) ratios, the Small Business classes will pay more relative  
18 to cost of service than other rate classes over a long period of time. Ms. Smith states:

19  
20 Under this scenario, Small Business Classes will be paying more than the  
21 cost of serving them in ten or twenty years.<sup>31</sup>

22  
23 Ms. Smith recommends that the deferrals be computed for each class based on the cost of  
24 service as opposed to the proposed revenues.

25  
26 NS Power's proposed Rate Stabilization Plan is concerned with setting rates for 2013 and  
27 2014<sup>32</sup> and does not attempt to set base cost rates for the years falling outside of this two  
28 test year horizon. The deferred cost estimates by rate classes, provided in Appendix B,

---

<sup>31</sup> Direct Testimony of Lee Smith, August 4, 2012, page 16, lines 301-303.

<sup>32</sup> Please refer to SBA(NSPI) IR-7.

REDACTED

---

1 are for illustrative purposes only. They are not intended to be used for tracking  
2 accumulated deferrals by individual rate classes.<sup>33</sup>

3  
4 Ms. Smith asserts that the COSS over allocates distribution costs to all secondary level  
5 customers, including Small Business classes, due to the use of allocation coefficients  
6 which have not been updated since the last generic cost of service hearing in 1995.

7  
8 By the Board's decision on the 2012 GRA, the COSS-related matters, including the  
9 updates of the coefficients concerned with sub-functionalization of distribution  
10 infrastructure, such as poles and dedicated substations, are to be determined in a generic  
11 cost of service hearing scheduled for 2013. These updates will require significant data  
12 collection and analysis that are not suitable for a review in a GRA proceeding concerned  
13 with cost pressures of revenue requirement. Absent a comprehensive review of all COS  
14 coefficients and allocators, not just those advocated by the consultant, the COSS outcome  
15 would be incomplete and possibly biased.

16  
17 If the Board approves the rate stabilization plan, the consultant's concerns about the  
18 "over charging" of her clients due to the use of the current COS model will go away.  
19 Under the proposed approach, the deferred costs will not be allocated among rate classes  
20 and reflected in base cost rates until they are set again at the next GRA. By that time,  
21 however, we anticipate that the COSS will reflect the Board's decision on the generic  
22 COS hearing.

23  
24 **6.2 COSS Methodology: Classification of Biomass Generation**

25  
26 Mr. Whalen recommends that the biomass rate base be classified on the basis of system  
27 load factor and in the same manner as other steam generation assets, such as coal-fired  
28 and oil-fired power plants, until the matter is more completely assessed in the upcoming

---

<sup>33</sup> This is to address the concerns of the Board's consultant, Mel Whalen, expressed on page 17, lines 4 – 7, of his evidence.

REDACTED

---

1 review of NS Power's COSS. He bases his recommendation on the fact that the biomass  
2 plant is a dispatchable steam plant, which provides capacity service and its operating  
3 costs are already classified in a similar manner as those of other steam and hydro plants.  
4 Mr. Whalen draws a parallel between the COS treatment of wind and biomass, which he  
5 assumes are classified between energy and demand.

6  
7 Mr. Whalen also observes that NS Power's treatment of wind classification has not been  
8 consistent over time. In GRA proceedings, preceding the 2012 GRA, this split stayed at a  
9 constant 30 percent / 70 percent split. Starting with the 2012 GRA it has changed to a 16  
10 percent / 84 percent split and in the 2013 GRA it was proposed by NS Power to change to  
11 a 2 percent / 98 percent split.

12  
13 The guidelines for classification of generation investments established in the 1995  
14 generic COS hearing which have evolved through decisions in subsequent GRAs leave  
15 some room for interpretation. The Board's decision on the generic COS hearing provided  
16 as follows.

17  
18 The Board directs that

- 19 (i) all generation costs associated with environmental compliance and  
20 fuel conversion are to be classified as energy related;
- 21 (ii) annual fixed costs associated with steam and hydro generation  
22 plant rate base asset are to be classified to energy on the basis of  
23 annual system load factor;
- 24 (iii) the annual system load factor is to be calculated on the basis of  
25 gross energy generation and annual coincident peak including  
26 interruptible load  
27

<sup>34</sup> COS & Rate Design Generic Hearing Board Order, September 22, 1995.

## NS Power 2013 General Rate Application Reply Evidence

REDACTED

---

1 Since no wind or biomass power plants were present on NS Power's system in 1995 they  
2 were not specifically mentioned in the decision. There were no renewable electricity  
3 standards (RES) in effect at that time, either.  
4

5 Wind generation assets added prior to 2005 were classified between demand and energy  
6 using 30 percent / 70 percent split. This was documented in NS Power's response to  
7 UARB IR-73 in the 2007 GRA.<sup>35</sup> At that time no environmental consideration was given  
8 to these projects as these investments were not driven by the RES targets.  
9

10 The investments in wind generation that came online after 2009 were classified in the  
11 COSS of the 2012 GRA up-front as energy-related only, because they were driven by  
12 RES targets and were justified as such in the ACE Plans. This approach was documented  
13 in NS Power's responses to CA IR-32 and NPB IR-35 from the 2012 GRA proceeding  
14 (please refer to Appendix G).  
15

16 This treatment of RES compliant wind investments explains why the weighted average  
17 split of the total wind generation rate base of NS Power between demand and energy  
18 started has changed the 2012 GRA. The changing nature of the environmental  
19 considerations appear to have been recognized by Mr. Whalen who in his evidence  
20 submitted in the 2012 GRA reiterated the Board's 1995 decision as follows.  
21

22 The underlying principle is to classify as energy those assets whose  
23 acquisition allows NS Power to produce energy more economically (such  
24 as the costs of converting units from one fuel to another) and/or enable NS  
25 Power to produce energy **in conformance with all environmental**  
26 **targets** (such as the addition of low NOx burners).<sup>36</sup> [Emphasis added]

27  
28 In its classification decision of the biomass rate base, similar to Mr. Whalen's reasoning,  
29 NS Power also drew a parallel with the classification of wind generation investments

---

<sup>35</sup> Please see Appendix F for details.

<sup>36</sup> GRA 2012 Direct Evidence of Mel Whalen, P.Eng, page 4, lines 14 – 17.

## NS Power 2013 General Rate Application Reply Evidence

**REDACTED**

---

1 made for RES purposes. Even though the biomass generation, in contrast to wind  
2 generation, is dispatchable and as such provides firm capacity to the system, the  
3 economic capacity-related aspect of this plant appeared to be of secondary importance to  
4 that of RES compliance. The project proceeded mostly on its merits in meeting the RES  
5 targets. To classify this asset on the basis of system load factor would mean that there  
6 would be no distinction between this primarily RES driven project and ordinary fossil-  
7 fuel fired base load generation.

8  
9 The classification of the operating expenses of all wind and biomass plants is consistent  
10 with the classification of their underlying rate bases. The operating costs of steam,  
11 hydro, wind, biomass and LM6000 are classified using the same one composite  
12 coefficient in COSS, which is already reflective of the weighted averaging effect of their  
13 underlying rate bases. Its effect on total classified operating costs is exactly the same as  
14 that that would be produced by distinct classifications of operating expenses of individual  
15 generation types based on application of simple, as opposed to composite, classifications  
16 of their distinct rate bases.

17  
18 NS Power respectfully submits that its approach to the classification of the biomass rate  
19 base and costs as submitted are appropriate.

20  
21 NS Power estimated the revenue effect of classifying the biomass rate base using system  
22 load factor as recommended by Mr. Whalen. The revenue effect of this change is muted  
23 by the application of a 95/105 R/C ratio band in the revenue allocation process. Only one  
24 class, the unmetered class, whose revenues are set exactly at cost of service, sees a direct  
25 \$15,000 increase effect of this reclassification. Under the applicable revenue allocation  
26 process this \$15,000 increase is redistributed as a decrease to all other rate classes  
27 producing negligible class revenue impacts.

REDACTED

1 **Figure 6-1**

Changes in 2013 test year class revenues due to Biomass reclassification by system load factor						
Rate Classes	May 2012 Filing		May 2012 Filing adjusted for re-classified biomass rate base		Revenue Variance	
	Revenue (in thousands of \$'s)	R/C Ratio	Revenue (in thousands of \$'s)	R/C Ratio	(in thousands of \$'s)	%
Residential	656,557	99.0	656,549	98.8	(8.0)	0.00%
Small General	35,079	104.6	35,078	104.8	(1.0)	0.00%
General	307,787	103.5	307,783	103.6	(4.0)	0.00%
Large General	42,151	98.2	42,150	98.7	(1.0)	0.00%
Small Industrial	31,739	102.6	31,739	102.9	-	0.00%
Medium Industrial	53,486	98.4	53,485	98.8	(1.0)	0.00%
Large Industrial	82,327	95.6	82,326	96.1	(1.0)	0.00%
Municipal	20,394	97.4	20,394	97.4	-	0.00%
Unmetered	24,633	100.0	24,648	100.0	15.0	0.06%

2  
3  
4 **6.3 Embedded Cost Recovery Mechanism (ECRM) under OATT**

5  
6 Mr. Whalen recommends that, given the complexity of the stranded cost issue, the  
7 determination of the ECRM matter be excluded from the 2013 GRA and deferred to a  
8 stand-alone proceeding. On September 6, 2012, the Board issued its decision in the  
9 expedited process to deny NS Power’s ability to seek an ECRM from the Municipal  
10 Electric Utilities. There is therefore no need for any discussion of the manner in which  
11 NS Power proposed to calculate the ECRM.

12  
13 NS Power understands that Board has not yet made a determination as to whether the  
14 MEUs are responsible for their deferred costs if they leave the system. NS Power  
15 submits that the MEU’s responsibility for any portion of their deferred costs not  
16 recovered at the time they may exit the system should continue to be borne by the MEU.

17  
18 With respect to NS Power’s application to update the prices for services offered under NS  
19 Power’s Open Access Transmission Tariff (OATT), no party has filed any evidence  
20 challenging NS Power’s proposal. NS Power requests that the OATT pricing be updated,  
21 as proposed in its Application.

REDACTED

---

1 **6.4 Streetlights**

2  
3 NS Power has been clear that the final rates for streetlights including conversion fees  
4 should be determined at the time of the capital work order process. This would avoid  
5 unnecessary confusion around estimates and allow for better use of resources in both the  
6 GRA and the capital work order proceedings.

7  
8 Despite the fact that there is no application before the Board for conversion fees for  
9 streetlights, nor a request for approval of a final determination of the value of the non-  
10 LED streetlights which will not be fully depreciated at the time that they are replaced by  
11 LED streetlights in accordance with pending regulation, HRM and the UNSM have  
12 submitted evidence seemingly requesting the Board to impose a manner of calculating  
13 both on NS Power through this General Rate Application.

14  
15 HRM's and the UNSM's Evidence contain several misconceptions respecting NS  
16 Power's accounting for streetlights which require correction as set out below.

17  
18 The book value of NS Power-owned streetlights has been established and approved  
19 through transparent regulatory processes: past rate applications, capital filings and  
20 depreciation studies. NS Power has prudently incurred these costs and is entitled to  
21 recover its investment from customers who have enjoyed the use of these assets.

22  
23 Streetlights have been pooled for accounting purposes as in the case with other assets that  
24 individually have small dollar values but are collectively material. Again, this method  
25 has been practiced and accepted over the course of many years and many rate  
26 applications.

27  
28 While Mr. Dominie's suggestion of using the Handy Whitman index may make sense for  
29 estimating original value, it does not correspond with current practice and would not  
30 ultimately change the stranded asset fee. The stranded asset fee is the net book value of

NS Power 2013 General Rate Application Reply Evidence

REDACTED

---

1 the asset group divided by the number of streetlights in service to produce an unrecovered  
2 amount per streetlight. To assist with understanding why this proposed methodology  
3 change does not affect the stranded asset fee the following accounting example is  
4 provided.

5  
6 Current streetlight retirement:

7  
8 NS Power removes a streetlight and estimates it was installed in 2001. Using the Bank of  
9 Canada index, the original value is determined to be \$200.

10  
11 Dr: Accumulated Depreciation – Street lighting 200  
12 Cr: Asset – Street lighting 200

13  
14 Streetlight retirement during LED conversion:

15  
16 NS Power removes a streetlight, to install a LED equivalent, and estimates it was  
17 installed in 2001. Using the Bank of Canada index, the original value is determined to be  
18 \$200.

19  
20 Dr: Accumulated Depreciation – Street lighting 25  
21 Dr: Regulatory Deferral – LED Conversion 175  
22 Cr: Asset – Street lighting 200

23  
24 NS Power removes a streetlight, to install a LED equivalent, and estimates it was  
25 installed in 2001. Using the Handy-Whitman index, the original value is determined to  
26 be \$220.

27  
28 Dr: Accumulated Depreciation – Street lighting 45  
29 Dr: Regulatory Deferral – LED Conversion 175  
30 Cr: Asset – Street lighting 220

REDACTED

---

1 Mr. Dominie also suggests that the age of each light be determined based on a date stamp  
2 located inside the fixture. Irrespective of the actual age of the light, it is the net book  
3 value of the assets that has not been recovered through rates. While his methodology  
4 may assist individual municipalities with understanding the age of their respective lights,  
5 it does not change the overall value owed to NS Power and would certainly increase costs  
6 to track this information.

7  
8 Previous streetlight rates have been set based on the approved cost of service  
9 methodology. NS Power uses depreciation, maintenance, allowed earnings and energy  
10 costs to prepare these rates. These items are then allocated using the approved inputs and  
11 methodology. This results in NS Power properly recovering expenses (depreciation,  
12 maintenance and energy) and earning on the investment as approved.

13  
14 Based on the regulatory processes and structure of the accounting and rates for  
15 streetlights, the assertion that streetlights have somehow already been paid for is  
16 unfounded. Until the 2012 GRA, HRM had never raised this concern through cost of  
17 service or rate design proceedings, depreciation proceedings, or general rate applications.

18  
19 The number of streetlights recorded in our Customer Information System, and used for  
20 billing purposes, is the best information currently available to NS Power. It is logical to  
21 believe that if the numbers were materially different, customers would have contacted NS  
22 Power for corrections to their bills. As part of the LED conversion, NS Power will be  
23 collecting more detailed street lighting information in the future.

24  
25 Mr. Dominie suggests in his evidence that there was a ‘negotiated settlement’ to set the  
26 stranded asset value permanently at \$12 million. With respect to streetlights, the 2012  
27 Settlement Agreement approved by the Board states:

28  
29 21. Streetlights – rates will be as proposed by NSPI subject to the  
30 following adjustments:

## NS Power 2013 General Rate Application Reply Evidence

REDACTED

---

- 1 a. Parties agree that LEDs will be used for all replacements effective  
2 immediately and until UARB approval of the new capital program.  
3 The cost of these interim change-outs will be capitalized and  
4 parties will support any U&U application that may be necessary to  
5 obtain UARB approval of this interim program.
- 6 b. Interim rate will be the rate as proposed in NSPI's May 13 filing  
7 subject to two changes:  
8 i. Fixture capital cost will be reduced by 15% from NSPI's  
9 original proposal. This reduction in the fixture capital cost  
10 will also apply to the January 1, 2012 rates.  
11 ii. No conversion fees will be charged until the 2012 LED  
12 Streetlight rates are in effect.
- 13 c. The proposed realignment of rates with costs of the unmetered  
14 services of electricity and fixture capital will be introduced in two  
15 phases beginning in January 2012. NSPI will submit at the time of  
16 2012 Compliance Filing a set of streetlight rates that will be  
17 effective January 1, 2012 that incorporate 50% (in terms of cost  
18 impact) of the methodological adjustments. The complete change  
19 will be made in the next General Rate Application.
- 20 d. **Without prejudice to a later determination of the value of**  
21 **stranded assets**, the parties agree that for the purposes of  
22 calculating the 2012 conversion fee, the format in NSPI's  
23 Appendix G, Schedule 10 will be used with a year-ending 2011  
24 Net Plant Value of \$12 million for rate-making purposes to be  
25 recovered over 10 years, rather than \$23 million predicated on a 5  
26 year recovery period as is the case under NSPI's Application. As  
27 well, the schedule will be amended to include forecast retirements  
28 and depreciation over the 10 year period. If the program timeline  
29 remains 5 years at the time of final UARB approval of the capital  
30 work order for LED Streetlights, parties acknowledge this value  
31 for stranded assets is not anticipated to be accurate.
- 32 e. NSPI is entitled to full recovery of its prudently incurred non-LED  
33 street light asset costs. **At future General Rate Applications,**  
34 **pricing of the energy and capital components of streetlight**  
35 **rates (LED, non-LED and conversion fees) will reflect NSPI's**  
36 **actual experience. NSPI will monitor the recovery of its**  
37 **stranded costs and is entitled to seek regulatory approval of**  
38 **changes to streetlight rates and conversion fees to ensure that**  
39 **all of its costs are recovered.**  
40

41 Clearly, the intent of the inclusion of the bolded wording above in subsections d and e  
42 was to agree that \$12 million was **not** the final value of the streetlights.

## NS Power 2013 General Rate Application Reply Evidence

REDACTED

---

1 Mr. Boyle in his testimony on behalf of HRM alleges that NS Power ‘abandoned’ the  
2 settlement agreement. We have not. NS Power has proceeded cautiously with LED  
3 streetlights installation for two reasons. First, the regulations requiring conversion have  
4 not yet been enacted. Second, as is apparent from the UNSM and HRM evidence, there  
5 has been concern about proceeding with the conversion. NS Power has been proceeding  
6 cautiously with the program in attempting to find an approach supported by stakeholders.

7  
8 Mr. Boyle also states, “Since the signing of the Settlement Agreement the original  
9 Schedule 10 has disappeared. HRM made submissions to the Board during the  
10 Compliance Filing stage on this issue.”<sup>37</sup> Some content may be helpful in considering  
11 his evidence. Following the Board’s Compliance Order, wherein it declined to reflect  
12 HRM’s request that NS Power be urged to file a revised Schedule 10, which is the  
13 schedule calculating conversion fees, in NS Power’s 2012 GRA application, HRM  
14 appealed the Board’s Order to the Nova Scotia Court of Appeal. Specifically, HRM  
15 complained that the Board erred in failing to provide a calculation of revised conversion  
16 fees.<sup>38</sup> On June 21, 2012, HRM filed a Notice of Discontinuance with the Court of  
17 Appeal, wholly discontinuing all aspects of its appeal. It is completely improper to now  
18 come back before this Board to complain that Schedule 10 ‘disappeared’ when the Board  
19 considered HRM’s submission, rejected HRM’s submission, and HRM subsequently  
20 withdrew its appeal of that Board Decision.

21  
22 NS Power’s approach with regards to calculating a stranded asset pool is simple and has  
23 not changed. That is, the net book value of the assets is the unrecovered investment. To  
24 determine per unit value, NS Power has proposed dividing the asset pool by the number  
25 of lights billed in the Customer Information System. NS Power has repeatedly stated  
26 through the 2013 & 2014 GRA application that the rates should be set with the capital  
27 work order process consistent with the 2012 Settlement Agreement. In an effort to be

---

<sup>37</sup> Direct Testimony of Julian Boyle, August 7, 2012, page 11, lines 23-25.

<sup>38</sup> HRM Amended Notice of Appeal, February 9, 2012.

## NS Power 2013 General Rate Application Reply Evidence

**REDACTED**

---

1 helpful, NS Power has provided information over the last couple of years. In fact, draft  
2 regulations were only issued April 25th, 2012.

3  
4 Despite our efforts to be helpful and request that the final stranded asset be dealt with  
5 when all information is available, Mr. Dominie has concluded that NS Power is hedging  
6 and making retroactive correction efforts. Ms. MacDonald also asserts that NS Power of  
7 being inconsistent. The letters attached to her testimony do not demonstrate that. They  
8 show a consistent approach evolving over a period of time. The August 27, 2010 letter  
9 was issued as part of an early pilot project. A letter issued to all municipalities on April,  
10 2012 was omitted from Ms. MacDonald's evidence and is attached for the Board's  
11 information as Appendix H.

12  
13 NS Power has worked with customers to understand their concerns and needs. We agree  
14 with Mr. Boyle's suggestion to continue to work together through a technical working  
15 group.

16  
17 In conclusion, NS Power maintains that the rates, including the conversion fees, should  
18 be determined during the capital work order process, and that the rates and fees should be  
19 expected to adjust over time as costs and knowledge are updated. As per testimony at the  
20 2012 ACE Plan Hearing, NS Power will file the application associated with conversion  
21 once final regulations are approved.

REDACTED

---

1    **7    LOW INCOME CONSIDERATIONS**

2  
3           Four organizations submitted evidence in support of the Affordable Energy Coalition:  
4           Dalhousie Legal Aid, North End Community Health Centre, Society of Saint Vincent de  
5           Paul and Parker Street Food Bank.

6  
7           Each of the groups provided helpful feedback on the experiences of low income  
8           customers. For families on social assistance or limited incomes who are already paying  
9           more for things like gasoline and groceries, power rate increases are a genuine burden.  
10          The key concerns raised by the groups related to fees, connection and disconnection of  
11          power, repayment plans and points of contact for addressing concerns of this type. We  
12          share the concerns articulated and acknowledge the challenges that low income  
13          customers face in working with the utility and numerous social service agencies to secure  
14          and maintain their electricity accounts in good standing.

15  
16          The issues raised were also tabled at a July 10 meeting held at NS Power to initiate action  
17          on the concerns of low-income advocacy groups. This meeting was attended by the four  
18          parties that have submitted evidence as well as a number of other representatives of  
19          Government and social agencies. NS Power is optimistic that this forum will serve to  
20          allow us to work collaboratively with interested parties to make amendments in process  
21          and structure with a vision to enhance customer service rules for low-income electricity  
22          customers that are transparent, fair and effective for all customers. A follow-up meeting  
23          is scheduled for October 26th. Subsequent meetings will be held as necessary to work  
24          through the issues and concerns. We believe working together as a group will be fruitful  
25          in identifying new approaches that can be adapted under existing regulations.

26  
27          Based on the comments and suggestions tabled at the July 10 meeting, NS Power is  
28          proceeding to make the following changes in its processes:

REDACTED

---

1       **1.       Creation of the Role of a Low-income Advocate within NS Power Customer**  
2       **Care**

3       The creation of a permanent role dedicated to Low-income advocacy account  
4       management with newly established guidelines and clear ability to work with both  
5       the Agencies and the actual customers in new and improved ways has occurred  
6       and is now available to our customers.

7  
8       **2.       Development of a new Low-income Customer Charter**

9       Education and communication are essential to a successful relationship between  
10      the customer and the utility and the various support agencies that assist low-  
11      income residents on a daily basis. New customers would receive information to  
12      better understand their energy consumption, their bill and programs available to  
13      them, including programs to conserve energy. A “customer charter” would also  
14      include general policy highlights, links, our responsibilities, and expectations and  
15      their responsibility around payments including contact information for resources  
16      and case management at the utility. A project team has been assigned to  
17      implement this and a mock up design will be shared for input with the Low  
18      Income Advocacy Committee at the October 26<sup>th</sup> meeting.

19  
20      **3.       Reform of Security deposits and Settlement Agreement terms of repayment**

21      We have identified the ability to extend repayment options beyond today’s current  
22      practise of 3 - 12 months for customers who require longer terms. We are also  
23      implementing greater flexibility in terms for collecting security deposits. We are  
24      moving forward with internal process review and redesign in 2012 and will also  
25      incorporate feedback on design from the low income advocacy workgroups.

26  
27      This will also include a change to customers who return as new customers with a  
28      past closed balance by allowing them to connect with repayment terms versus  
29      “balance in full” as a prerequisite. These process changes will be in place by  
30      September 10, 2012 as part of standard customer service processes.

REDACTED

1           **4. Identification of potential regulatory or statutory reforms**

2           Work has begun to identify and benchmark programs and approaches offered  
 3           across other Canadian Utilities and the United States. Alternative proposals for  
 4           regulatory reform in Nova Scotia will be documented and brought to the October  
 5           29<sup>th</sup> meeting.

6  
 7           References were made in the evidence of certain low income advocates of winter-  
 8           time disconnections. Figure 7-1 provides the 2011-2012 monthly summary of  
 9           Residential Disconnections for reference. This data is also provided from NS  
 10          Power's response to AEC IR-10.

REDACTED

---

1   **8 CONCLUSION**

2  
3       At the time of filing its Application, NS Power proposed a Rate Stabilization Plan to  
4       provide customers with time to adjust to the changing landscape of electricity customers  
5       in Nova Scotia, while needing to make important investments in the system to achieve a  
6       better electricity future - lower emissions, green energy, better reliability and freedom  
7       from volatile world coal markets.

8  
9       With continued loss of load, with the loss of Bowater just one month after NS Power's  
10      filing, NS Power believes now more than ever that a Rate Stabilization Plan is the best  
11      option for customers.

12  
13      NS Power seeks an order, effective January 1, 2013, approving:

- 14
- 15      •       The 2013 and 2014 revenue requirements set out in this Evidence to enable NS  
16      Power to recover the reasonable costs of providing service to customers and to  
17      meet its financial obligations.
  - 18  
19      •       The Rate Stabilization Plan, which provides for the recovery of the 2013 and 2014  
20      revenue requirements as follows:
    - 21  
22          •       For each customer class, an average 3 percent increase on January 1, 2013  
23          and an average 3 percent increase on January 1, 2014, after factoring in  
24          the 2010 FAM deferral reductions in 2013 and 2014,
    - 25  
26          •       Deferral of any portion of the Board approved revenue requirement not  
27          recovered by the average 3 percent annual increases. Effectively, this will  
28          continue the 2012 Fixed Cost Recovery deferral, which will continue to  
29          grow until the end of 2014, with recovery of the deferral over an 8 year  
30          period beginning in 2015,

## NS Power 2013 General Rate Application Reply Evidence

**REDACTED**

---

- 1           •       FAM adjustments, other than for the 2010 FAM deferral reductions and  
2                     the 2011 FAM imbalance both of which are reflected in the 2013 FAM  
3                     Balance Adjustment, will be deferred, to be incorporated into customer  
4                     rates beginning in 2015
- 5
- 6           •       The FAM incentive will remain suspended until the end of 2014.
- 7

8       The rates, charges and regulations requested in this Application.

9

- 10       •       Changes to the Large Industrial Interruptible Rider and Load Retention Tariff  
11                     Pricing Mechanism, as described in this Application.
- 12
- 13       •       A change to Accounting Policy 5900 – Tax, to allow for the accounting of fixed  
14                     cost recovery deferrals on a deferred tax basis, in order to align tax expense with  
15                     the deferral recovery period.
- 16
- 17       •       A change in the Open Access Transmission Tariff (OATT) rates to reflect updated  
18                     pricing as described in the Application.
- 19
- 20       •       Adjustments to the rates, charges, or regulations as needed to reflect decisions and  
21                     directives in NS Power related proceedings or as the Board may determine in  
22                     response to this Application.
- 23
- 24       •       A return on common equity range held at the current 9.1 percent to 9.5 percent.
- 25
- 26       •       In the alternative to the Rate Stabilization Plan, recovery of the 2013 and 2014  
27                     revenue requirement using traditional rate-setting methodology as provided in the  
28                     rates, charges and regulations contained in this Application.

## Changes in the total Revenue Requirements

Absent the rate stabilization plan, our May application forecasted total revenue at present rates of \$1,192.6<sup>1</sup> million in 2013 and \$1,320.4 million in 2014 (priced at rates proposed for 2013). Based largely on the Bowater shutdown, we have reduced our forecast revenue at present rates to \$1,136.9 million (2013) and \$1,266.7 million (2014). Comparing these new forecasts to the updated 2013 and 2014 revenue requirements (\$1,269.7 million and \$1,325.1 million), leaves a shortfall of \$132.8 million in 2013 and \$58.4 million in 2014.

These amounts include some revenue related to the LED streetlight replacement program. We account for this revenue — \$2.0 million in 2013 and \$4.3 million in 2014 — as a *below the line* item, which means it will not affect general rates, but will be allocated to specific users according to a Board-approved formula. After adjusting for these amounts, the shortfall applicable to above-the-line and Miscellaneous Service Rates is \$132.4 million in 2013 and \$58.3 million in 2014 (Above-the-line rates are those intended to recover NS Power's revenue requirement according to cost-of-service principles, in which the rates paid by each class of customer is intended to recover the cost of servicing that customer class).

## Revenue Responsibilities Allocated to Above the Line Classes and Miscellaneous Revenues

The following tables show the process NS Power used to allocate revenue responsibilities among various customer classes and business services for 2013 and 2014. NS Power provides these calculations for illustrative purposes only, to show what the revenue responsibility for each class would be if the rate stabilization plan was not proposed.

---

<sup>1</sup> The figure of \$1,192.6 million is arrived at by subtracting the forecasted FAM BA revenue of \$29.2 million for 2013 from the total revenues of \$1,221.8 (present rates) displayed in the financial table FOR-01.

1           **2013 Results (before rate stabilization plan)**

2

3           Figure 1 presents 2013 revenue-to-cost ratios for customer classes resulting from the

4           proposed revenue increases. Revenue-to-cost ratios for all rate classes fall within the

5           prescribed 95 – 105 percent band. All classes except unmetered and small general see a

6           uniform increase of 11.9 percent.

1 **I. INTRODUCTION AND SUMMARY OF CONCLUSIONS**

2

3 **Q. What is the purpose of your rebuttal evidence in this proceeding?**

4

5 A. The purpose of my rebuttal evidence is to respond to certain issues related to capital  
6 structure and return on equity raised in the Evidence of Laurence D. Booth filed on behalf  
7 of the Counsel for the Nova Scotia Utility and Review Board and the Direct Testimony of  
8 Lee Smith filed on behalf of the Small Business Advocate. The fact that I do not address  
9 specific areas of their evidence should not be construed to mean that I agree with either  
10 the analysis or conclusions. My qualifications were previously filed as Appendix E to  
11 my Opinion on Capital Structure and Return on Equity for Nova Scotia Power Inc.  
12 ("NSPI").

13

14 **Q. Please summarize the recommendations of Dr. Booth for NSPI's 2013 and 2014 test**  
15 **years.**

16

17 A. Dr. Booth recommends ROEs of 7.50% and 8.50% for 2013 and 2014 respectively. Dr.  
18 Booth regards NSPI's 37.5% common equity ratio used for rate setting purposes as  
19 reasonable. In spite of his own calculations, Dr. Booth concludes that NSPI's request to  
20 be allowed 9.2% on 37.5% common equity to be within reasonable financial metrics  
21 (page 4).

22

23 **Q. Please summarize the Ms. Smith's recommendations as they relate to cost of capital.**

24

25 A. Ms. Smith's testimony supports a reduction in ROE due to alleged lower risk in NSPI's  
26 proposed two-year rate stabilization plan and due to lower interest rates. She also  
27 suggests that the Company's forecast deferrals could be financed with a greater  
28 proportion of debt than has been proposed.

29

30

31 **Q. Could you please summarize the conclusions you have drawn in your rebuttal**  
32 **evidence?**

33

34 A. My conclusions with respect to Dr. Booth's evidence are:

35

36 (1) Dr. Booth agrees that, despite his recommended ROEs, NSPI's request for an  
37 allowed return of 9.2% on 37.5% common equity to be within reasonable  
38 financial metrics.

39

40 (2) Dr. Booth's assertion that NSPI is of comparable risk to a "benchmark" or average  
41 risk Canadian utility is incorrect. NSPI's higher risk relative to the typical  
42 regulated Canadian utility means its cost of equity is higher and its allowed return  
43 on equity should be higher than that applicable to the typical Canadian utility.  
44 NSPI's higher than average financial risk alone warrants a higher ROE than  
45 applicable to a "benchmark" Canadian utility.

46

47 (3) Dr. Booth underestimates NSPI's business risk. His position that NSPI is  
48 comparable in risk to gas distribution utilities ignores the fundamentally higher  
49 business risks of NSPI. As Dr. Booth also fails to account for NSPI's lower than  
50 average common equity ratio, his recommendation that an average risk (or  
51 "benchmark") utility ROE would be applicable to NSPI is doubly flawed.

52

53 (4) Dr. Booth's utility benchmarks for assessing the reasonableness of NSPI's capital  
54 structure are either inconsistent with what the regulator determined to be  
55 appropriate, outdated, or incomplete. Dr. Booth's selection of benchmarks is  
56 selective and is limited to companies with allowed equity ratios at the lower end  
57 of the range of equity ratios allowed for Canadian utilities. The average allowed  
58 equity ratio for all investor-owned Canadian utilities with rated debt (excluding  
59 NSPI), virtually all of which are of lower business risk than NSPI, is 40%, higher  
60 than NSPI's deemed common equity ratio of 37.5%.

61

- 62 (5) Dr. Booth's contention that NSPI would be A- rated by S&P on a stand-alone  
63 basis (i.e., if it were not for Emera) is speculative at best, particularly given that  
64 NSPI's credit metrics have generally weakened over the past five years.
- 65
- 66 (6) Dr. Booth's virtual exclusive reliance on the Capital Asset Pricing Model (CAPM)  
67 is not reasonable. Only by applying a range of tests along with informed  
68 judgment can adherence to the fair return standard be ensured, where the fair  
69 return standard includes the comparable returns requirement, as well as the  
70 maintenance of financial integrity and the ability to attract capital.
- 71
- 72 (7) Dr. Booth's review of the major 2009 cost of capital reviews in Canada fails to  
73 either fully report (BCUC) or ignores (OEB) regulators' views where the CAPM  
74 was not the principal test considered.
- 75
- 76 (8) The application of the CAPM is particularly problematic in current financial  
77 market conditions. The historically low level of long-term Government of  
78 Canada bond yields has little, if any, correlation with trends in the market cost of  
79 equity.
- 80
- 81 (9) With reasonable estimates of the market risk premium and relative risk  
82 adjustment, the application of the CAPM at Dr. Booth's forecast long-term  
83 Canada bond yield of 3.5% during NSPI's test period indicates a cost of equity of  
84 9.6%, higher than the 9.2% ROE that NSPI is requesting.
- 85
- 86 (10) Reliance on direct estimates of the utility equity risk premium derived from  
87 historical averages supports a utility cost of equity in the range of approximately  
88 9.75% to 10.75%, higher than the 9.2% ROE requested by NSPI, even before any  
89 adjustment for financing flexibility.
- 90
- 91 (11) Dr. Booth, by effectively dismissing the application of the Discounted Cash Flow  
92 (DCF) test to utilities, is at odds with the majority of utility cost of equity experts  
93 in North America, including those that have appeared before the UARB in NSPI  
94 rate proceedings.
-

- 95 (12) Dr. Booth's concerns regarding reliance on analysts' earnings growth forecasts in  
96 DCF tests applied to utilities are unfounded.  
97
- 98 (13) My estimated DCF costs of equity for a sample of U.S. electric utilities of  
99 comparable risk to NSPI, which are based on three different models, support a  
100 "bare bones" cost of equity of 9.25%, approximately equal to NSPI's requested  
101 ROE of 9.2%. The addition of an adjustment for financing flexibility equal to the  
102 0.50% used by Dr. Booth supports an ROE for NSPI, even without an adjustment  
103 for NSPI's lower regulated common equity ratio of 37.5%, of 9.75%.  
104
- 105 (14) Dr. Booth's concern with the use of U.S. data and utilities is inconsistent with his  
106 considerable reliance on U.S. data in the development of his evidence.  
107
- 108 (15) Dr. Booth's attempt to discredit the use of U.S. electric utilities as comparables for  
109 NSPI is based on a sample whose selection criteria were not well defined and  
110 which is of relatively higher risk than my sample of electric utilities.  
111
- 112 (16) A comparison of the historical widely available *Value Line* betas for Dr. Booth's  
113 and my vertically integrated electric utility samples and Dr. Booth's low risk U.S.  
114 utility sample indicates similar betas over time. The comparison highlights that  
115 (a) beta is only one means by which relative risk can be assessed and (b) in  
116 isolation, the history of *Value Line* betas does not indicate significant differences  
117 in risk among the samples.  
118
- 119 (17) The average debt ratings for my sample of electric utilities are equal to or higher  
120 than those applicable to NSPI. From a debt rating perspective, NSPI is of  
121 comparable to higher total risk than my U.S. electric utility sample, and its ROE  
122 should be comparable to, or somewhat higher than, the returns on equity available  
123 to its peers.  
124

125 (18) In the past year, the ROEs adopted for all U.S. utilities (electric and gas  
126 combined) have averaged approximately 10.0%. The corresponding average  
127 ROE adopted for utilities in my electric utility sample was 10.1%. Both averages  
128 are higher than NSPI's requested 9.2% ROE and underscore the conservative  
129 nature of NSPI's request.

130

131 With respect to Ms. Smith's evidence:

132

133 (1) Ms. Smith incorrectly characterizes the Company's requested return on equity as  
134 an Earnings Sharing Mechanism. NSPI's ROE is expressed within a range.  
135 During the two year test period, the upper end of the range serves as a cap on the  
136 NSPI's ROE above which customers receive 100% of the benefits. If NSPI earns  
137 below the allowed ROE, the short-fall is to the account of the shareholder.

138

139 (2) Contrary to Ms. Smith's claim, NSPI's ROE range comprises a very limited  
140 ability to earn returns above the 9.2% at which rates will be set, considerably less  
141 than is typical.

142

143 (3) Ms. Smith's claim that the proposed two-year rate stabilization plan lowers  
144 NSPI's risk is erroneous. In principle, extending a test period does not lower risk.  
145 Moreover, NSPI's proposal to limit rate increases and defer recovery of forecast  
146 test period costs well beyond the test period increases the uncertainty that those  
147 costs will be recoverable.

148

149 (4) Ms. Smith's recommendation that deferred amounts be financed with short term  
150 debt is unreasonable. Short-term debt financing is not only incompatible with the  
151 extended period over which the deferred costs are to be recovered, but would  
152 create higher leverage and weaker credit metrics.

153 (5) Ms. Smith's suggestion that a lower ROE is justified due to lower interest rates is  
154 unsupported. NSPI's requested ROE of 9.2% is conservative in light of both the  
155 Company's risk profile and returns available to its peers.

156 **II. REBUTTAL TO DR. BOOTH**

157

158 **A. CAPITAL STRUCTURE AND ROE**

159

160 **Q. At page 36 of his Evidence, Dr. Booth concludes that NSPI's 37.5% common equity**  
161 **ratio is fair and reasonable. At page 83 of his Evidence, he judges that NSPI is**  
162 **similar to the "benchmark utility", and recommends the same ROE for NSPI that**  
163 **would be applicable to a "benchmark utility." Please comment.**

164

165 A. I understand Dr. Booth's use of the term "benchmark utility" to mean an average risk  
166 utility.<sup>1</sup> In this context, risk comprises both business and financial risk. In other words,  
167 at the current capital structure, containing 37.5% common equity, he considers NSPI to  
168 be an average risk Canadian utility, to which he concludes his "benchmark utility" ROE  
169 should apply.

170

171 **Q. Does Dr. Booth conclude that NSPI faces lower than average business risk?**

172

173 A. No. Nowhere in Dr. Booth's testimony does he suggest that NSPI faces lower than  
174 average business risk compared to other Canadian utilities. In fact, he considers NSPI to  
175 be comparable to Gaz Métro (page 36), a utility that Dr. Booth considers to face above  
176 average business risk.<sup>2</sup>

177

178 **Q. Do you agree with Dr. Booth's conclusion that NSPI is of comparable risk to a**  
179 **"benchmark" or average risk Canadian utility?**

180 A. No. I discuss in detail below why NSPI faces higher business risks than the typical  
181 Canadian utility. However, even if NSPI did face "average" business risk relative to its

---

<sup>1</sup> In response to Enbridge Gas New Brunswick's Information Request No. 12 (August 2010), Dr. Booth stated that his "use of the phrase benchmark is similar to that in Alberta: a typical or average risk utility where other ROEs can be keyed off this base."

<sup>2</sup> In "Fair Return and Capital Structure for Gaz Metro, Evidence of Laurence D. Booth", filed with the Régie de l'énergie du Québec in July 2011, Dr. Booth stated that Gaz Métro's overall risk is higher than that of the benchmark utility, due to the composition of its customer base and competition with Hydro Québec, partly offset by the more extensive use of deferral accounts and the impact of performance based regulation (page 4).

182 Canadian peers, its financial risk, as captured in its deemed common equity ratio, is  
183 higher than average. NSPI's higher than average financial risk (lower than average  
184 common equity ratio) alone warrants a higher ROE than applicable to a "benchmark"  
185 Canadian utility.

186

187 **Q. At pages 22-23 of his Evidence, in judging whether NSPI's existing capital structure**  
188 **is fair and reasonable, Dr. Booth refers to the U.S. Supreme Court decision, *Federal***  
189 ***Power Commission v. Hope Natural Gas Co. (320 US 591, (1944)). Does Dr. Booth***  
190 **take into account all relevant aspects of that decision?**

191

192 A. No. Dr. Booth focuses solely on the financial integrity criterion of *Hope*. Dr. Booth cites  
193 the portion of the decision that states that the fair return "should be sufficient to assure  
194 confidence in the financial integrity of the enterprise so as to maintain its credit and to  
195 attract capital." He fails to mention that the *Hope* decision also includes the comparable  
196 returns requirement. The full citation is: "**By that standard, the return to the equity**  
197 **owner should be commensurate with returns on investments in other enterprises**  
198 **having corresponding risks.** That return, moreover, should be sufficient to assure  
199 confidence in the financial integrity of the enterprise, so as to maintain its credit and to  
200 attract capital." (emphasis added) The full citation encompasses all three requirements of  
201 the fair return standard.

202

203 **Q. What is the implication of the comparable returns criterion of the *Hope* decision as**  
204 **regards a fair return for NSPI?**

205

206 A. The implication is that the overall return for NSPI, which considers both the capital  
207 structure and ROE, should meet the comparable return requirement of the fair return  
208 standard articulated in *Hope*. Dr. Booth's application of a "benchmark utility" ROE to  
209 NSPI at its current capital structure fails to meet the comparable returns standard as it  
210 neither takes account of NSPI's lower than average common equity ratio nor of NSPI's  
211 higher than average business risk.

212

213 **Q. In judging whether NSPI’s capital structure is reasonable, Dr. Booth uses several**  
 214 **benchmarks, including the 31% common equity ratio he recommended for two**  
 215 **Alberta integrated electric utilities in 1996. Please comment on the relevance of that**  
 216 **benchmark.**

217  
 218 A. The 31% common equity ratio recommended by Dr. Booth for Alberta Power and  
 219 TransAlta Utilities in 1996 is not relevant to the assessment of the reasonableness of  
 220 NSPI’s common equity ratio. First, the Alberta regulator did not accept a 31% common  
 221 equity ratio for the integrated electric utilities at the time. In Decision U97097 (October  
 222 1997), the Alberta Energy and Utilities Board (“AEUB”, predecessor to the Alberta  
 223 Utilities Commission) found:

224  
 225           Having regard to the current ratio of preferred equity, the Board is not persuaded  
 226           that a common equity component in the range of 31-33%, as recommended by  
 227           CGCL for an integrated utility would preserve the utility’s ability to access  
 228           financial markets at reasonable terms and conditions. (page 230)  
 229

230 The AEUB approved a common equity ratio for TransAlta of 40% and a common equity  
 231 ratio of 35.7% for Alberta Power, considering that the higher common equity ratio for  
 232 TransAlta was warranted due to its lower preferred share component (10% compared to  
 233 16% for Alberta Power).<sup>3</sup>

234  
 235 Moreover, what the AEUB found to be reasonable in 1997 is not relevant currently.  
 236 Common equity ratios have generally risen since 1997. Although it is not possible to  
 237 make an “apples to apples” comparison, as there are no longer any integrated electric  
 238 utilities in Alberta, due to restructuring, the trend in the common equity ratios of the two  
 239 functions that are still regulated (transmission and distribution) provides some  
 240 perspective. In ATCO Electric’s first litigated general rate application post-restructuring,  
 241 the deemed common equity ratios for the transmission and distribution operations were

---

<sup>3</sup> In Decision U99099 (November 1999), the EUB concluded that an integrated common equity ratio of 40% to 42%, with a preferred share component of 9.5%, was appropriate for TransAlta.

242 set at 32% and 35% respectively,<sup>4</sup> raised to 33% and 37% respectively in the Generic  
 243 Cost of Capital decision in 2004,<sup>5</sup> and raised again in the 2009 Generic Cost of Capital  
 244 Decision to 36% and 39% respectively.<sup>6</sup> The increases in the 2009 Generic Cost of  
 245 Capital Decision represented a two percentage point across the board increase plus a one  
 246 percentage point additional increase for the transmission operations to recognize the  
 247 impacts of the forecast large capital additions on the credit metrics. The common equity  
 248 ratio of the transmission operations was further increased to 37% in the 2011 Generic  
 249 Cost of Capital decision, again to mitigate the effects of the large capital build on the  
 250 utility's credit metrics.<sup>7</sup> The common equity ratio of ATCO Electric's distribution  
 251 operations, which are of lower business risk than NSPI, remains at 39%, higher than  
 252 NSPI's 37.5%.

253

254 **Q. Dr. Booth also uses Gaz Métro's common equity ratio of 38.5% as a benchmark to**  
 255 **assess the reasonableness of NSPI's common equity ratio. Please comment on the**  
 256 **relevance of that ratio.**

257

258 A. Dr. Booth's comparison of Gaz Métro's deemed common equity ratio to NSPI's deemed  
 259 common equity ratio of 37.5% does not tell the full story. Gaz Métro also has a 7.5%  
 260 deemed preferred share component. It does not have **actual** preferred equity. Dr. Booth  
 261 did not mention this deemed preferred component in his NSPI evidence, but  
 262 acknowledged in response to NSPI (Booth) Request IR-10 that:

263

264 Deeming does not increase risk the way that an actual issue of preferred shares  
 265 does, so implicitly Gaz Metro has significantly more common equity that (sic) the  
 266 typical Canadian gas distribution utility and I would regard this as the offset to its  
 267 higher business risk.

268

---

<sup>4</sup> Alberta Energy and Utilities Board, *ATCO Electric, 2003-2004 General Rate Application, Decision 2003-071*, October 2003.

<sup>5</sup> Alberta Energy and Utilities Board, *Generic Cost of Capital, Decision 2004-052*, July 2004.

<sup>6</sup> Alberta Utilities Commission, *2009 Generic Cost of Capital, Decision 2009-216*, November 2009.

<sup>7</sup> Alberta Utilities Commission, *2011 Generic Cost of Capital Decision, Decision 2011-474*, December 2011. In an earlier decision, ATCO Electric's transmission operations were also allowed to include CWIP in rate base and utilize the future income tax methodology for federal income taxes to mitigate credit metric effects of the utility's large capital build. (*ATCO Electric Ltd. 2011-2012 Phase 1 Distribution Tariff 2011-2012 Transmission Facility Owner Tariff, Decision 2011-134*, April 2011)

269 In other words, with a 7.5% deemed preferred equity component, Dr. Booth concluded  
270 that Gaz Métro was equivalent to a benchmark, or average risk, utility. NSPI's regulated  
271 common equity ratio of 37.5% is already marginally lower than Gaz Métro's 38.5% and  
272 NSPI has no deemed preferred equity component. If, as Dr. Booth contends, Gaz  
273 Métro's deemed 7.5% deemed preferred component implicitly results in significantly  
274 more common equity than the typical gas distribution utility, Dr. Booth has understated  
275 Gaz Métro's common equity ratio in assessing NSPI's capital structure. The corollary to  
276 this conclusion is that, even if NSPI were of no higher business risk than Gaz Métro,  
277 NSPI would require a higher ROE than is applicable to an average risk or "benchmark"  
278 utility.

279

280 **Q. Do you have any comments on Union Gas as a benchmark?**

281

282 A. Yes. As I discuss below, as a vertically integrated electric utility, NSPI is of higher  
283 business risk than gas and electric distribution utilities. In that regard, in my opinion, a  
284 comparison to Union demonstrates only that NSPI's common equity ratio is marginally  
285 higher than that of a single utility with lower business risk. Dr. Booth fails to  
286 acknowledge that all of the electricity distribution utilities in the same regulatory  
287 jurisdiction, including large utilities (Hydro One and Toronto Hydro), are allowed  
288 common equity ratios of 40%, as is Hydro One's electric transmission operations. He  
289 also failed to acknowledge that Union Gas is applying for an increase in its common  
290 equity ratio to 40%, equivalent to that of the Ontario electricity distribution utilities. He  
291 does not consider the 39% and 40% allowed common equity ratios of ATCO Gas and  
292 FortisBC Energy Inc., two other large gas distribution utilities, which have been  
293 considered benchmark utilities by Dr. Booth.<sup>8</sup> Nor does he mention the 39% generic  
294 allowed common equity ratio of electricity distribution utilities in Alberta (referenced  
295 above for ATCO Electric). He does mention the 40% common equity ratio of FortisBC  
296 Inc., but appears to dismiss this data point because FortisBC Inc. has low risk hydro  
297 assets and is, according to Dr. Booth, "a very small utility" (page 4), despite the fact that  
298 FortisBC Inc.'s rate base is in excess of \$1 billion. He also appears not to consider the

---

<sup>8</sup> Laurence Booth Response to Heritage Gas Information Request 13, October 2011.

299 45% common equity ratio of Newfoundland Power, which he considers to be an average  
 300 business risk utility.<sup>9</sup> Essentially, Dr. Booth has selected “comparables” with allowed  
 301 equity ratios at the lower end of the range of equity ratios allowed for Canadian utilities.  
 302 The allowed equity ratio for all investor-owned Canadian utilities with rated debt  
 303 (excluding NSPI) is 40%, higher than NSPI’s deemed 37.5%.<sup>10</sup>

304

305 **Q. At page 13, Dr. Booth claims that NSPI would probably be A- rated by S&P if it**  
 306 **were not for Emera. He also concludes that, on a stand-alone basis, NSPI would still**  
 307 **have a very good investment grade bond rating with a significantly lower common**  
 308 **equity ratio. Please address these assertions.**

309

310 A. Dr. Booth’s contention that NSPI would be rated A- by S&P if it were not for Emera is  
 311 speculative at best. Virtually all S&P’s rating actions have been directly related to NSPI.  
 312 NSPI was downgraded by S&P from A- to BBB+ in December 2001, as was Emera.  
 313 The downgrade reflected S&P’s views at the time of the impact on NSPI of the  
 314 introduction of competition into the provincial electric utility industry and of  
 315 competition from natural gas.<sup>11</sup> NSPI and Emera were downgraded from BBB+ to BBB  
 316 in June 2006. Again, the rating actions for both NSPI and Emera were related to NSPI  
 317 specific factors, i.e., an expectation that NSPI’s historically weak cash flow metrics  
 318 would not materially improve in the next several years given no assurance of full  
 319 recovery of fuel-related expense under the prevailing regulatory framework; an evolving  
 320 fuel procurement strategy; and upcoming challenges related to the approval, financing,  
 321 and execution of several proposed capital projects.<sup>12</sup> The upgrade from BBB to BBB+  
 322 in September 2009 was related to the adoption of the FAM at NSPI.<sup>13</sup> The negative  
 323 trend that was assigned to NSPI and Emera in April 2012 was attributable to factors at

<sup>9</sup> “Fair Return for Newfoundland Power, Evidence of Laurence D. Booth”, May 2012, page 2.

<sup>10</sup> The allowed common equity ratios for individual Canadian utilities are found on Schedule 2, page 1 of 2 of my direct testimony.

<sup>11</sup> S&P, *Various Ratings Actions on Nova Scotia Power Inc: Outlook Stable*, December 21, 2001 and *Summary: Emera Inc.* December 28, 2011.

<sup>12</sup> S&P, *Research Update: Emera Inc., Subsidiary Nova Scotia Power Inc. Ratings Lowered to 'BBB', Off Watch*, June 21, 2006.

<sup>13</sup> S&P, *Research Update: Emera Inc., Subsidiary Nova Scotia Power Inc. Ratings to 'BBB+' from 'BBB' As Fuel-Adjustment Mechanism Implemented; Outlook Stable*, September 14, 2009.

324 NSPI, i.e., S&P's expectation of heightened regulatory risk due to the potential upward  
325 pressure on rates due to expected development projects that the company is pursuing and  
326 the impact on cash flow.<sup>14</sup> The history of rating actions by S&P does not support the  
327 contention that NSPI would be A- rated if it were not for Emera.

328

329 **Q. What about Dr. Booth's contention (page 4) that there are signs of double leverage**  
330 **of NSPI's assets at Emera?**

331

332 A. Dr. Booth's conclusion appears to be based on a faulty comparison of equity ratios. At  
333 page 13, Dr. Booth calculated Emera Inc.'s 2011 common equity ratio inclusive of  
334 accumulated other comprehensive income (AOCI). AOCI is comprised of unrealized  
335 gains and losses, principally on pension plans, foreign currency translation and  
336 investments available for sale. In both Emera's and NSPI's 2011 GAAP financial  
337 statements, AOCI reduces total reported common equity. For Emera the reduction is  
338 largely due to unrealized pension plan losses; for NSPI, the reported reduction to equity  
339 is 100% related to pensions. The same calculation using NSPI's 2011 GAAP financial  
340 statements performed by Dr. Booth for Emera would have produced a lower common  
341 equity ratio for NSPI than for Emera. However, NSPI's regulated common equity ratio  
342 excludes AOCI, consistent with the calculation of rate base and regulated income.<sup>15</sup>

343

344 **Q. Are there any other considerations that support the conclusion that NSPI would be**  
345 **a BBB+ rated utility on a stand-alone basis?**

346

347 A. Yes. Before the ratings were withdrawn in March 2010, Moody's rated NSPI Baa1,  
348 which is equivalent to BBB+ on S&P's rating scale. The most recent Moody's credit  
349 opinion prior to the withdrawal of the ratings, which made no mention of Emera,  
350 reflected the adoption of the FAM. Moody's credit opinion noted that NSPI's financial  
351 metrics were weaker than those of other smaller integrated electric utilities with similar

---

<sup>14</sup> S&P, *Emera Inc.* April 18, 2012 and *Nova Scotia Power Inc.*, April 18, 2012.

<sup>15</sup> DBRS adjusts NSPI's debt to capital ratios by adding back to equity the reduction resulting from the pension liability adjustment required under U.S. GAAP (DBRS, *Rating Report: Nova Scotia Power Inc.*, July 27, 2012.

352 ratings, as well as weaker than those of Baa1 rated transmission and distribution  
353 utilities.<sup>16</sup>

354

355 **Q. Have there been any developments that would suggest NSPI would be rated higher**  
356 **than Baa1 today by Moody's?**

357

358 A. No. Moody's did indicate that there could be an upgrade if some combination of the  
359 following occurred: a significant sustainable improvement in credit metrics, further  
360 improvements in relationships with the UARB and other stakeholders leading to an  
361 increase in equity thickness, more rapid recovery of regulatory assets or similar  
362 measures, and a reduction of the Company's exposure to existing and potential  
363 environmental legislation/regulation related to its predominantly coal-fired fleet. There  
364 has not been an improvement in NSPI's credit metrics. NSPI's credit metrics have been  
365 weaker since the issuance of Moody's credit opinion. Rebuttal Schedule 1 attached to  
366 this testimony demonstrates that NSPI's credit metrics have generally weakened over the  
367 past five years and, in the past two years, have been weaker than those of other investor-  
368 owned Canadian electric and gas utilities. There has not been an increase in equity  
369 thickness, more rapid recovery of regulatory assets or similar measures, or a reduction in  
370 the Company's exposure to existing and potential environmental legislation/regulation  
371 related to its coal-fired fleet.

372

373 **Q. Do the above considerations support Dr. Booth's contention that NSPI would "still**  
374 **have a very good investment grade bond rating" with "a significantly lower**  
375 **common equity ratio"?**

376

377 A. No. The above considerations indicate that NSPI would be BBB+ and Baa1 rated on a  
378 stand-alone basis by S&P and Moody's respectively. Therefore, if on a stand-alone  
379 basis, at its current deemed common equity ratio of 37.5%, NSPI is able to achieve only  
380 BBB+/Baa1 ratings, Dr. Booth's contention is incorrect.

381

---

<sup>16</sup> Moody's, *Credit Opinion: Nova Scotia Power Inc.*, November 17, 2009.

382 **B. BUSINESS RISK OF NSPI**

383

384 **Q. Dr. Booth claims that NSPI's business risk is comparable to that of gas distributors,**  
385 **including Union Gas, Gaz Métro and Enbridge Gas (page 33). Do you agree with**  
386 **this conclusion?**

387

388 A. No. Dr. Booth's conclusion that NSPI is of comparable business risk to that of gas  
389 distribution utilities is premised on his view that regulation in Canada neutralizes  
390 fundamental business risk differences among utilities. The implication of this view is  
391 that, no matter what the type of utility or what the underlying economics of its business,  
392 regulation in Canada protects the utility and its shareholders to the extent that virtually all  
393 Canadian utilities are of reasonably comparable business risk. I disagree with that  
394 premise.

395

396 I do not disagree with Dr. Booth that regulatory mechanisms can mitigate year-to-year  
397 earnings volatility and short-term forecasting risk. However, the fact that utilities are  
398 regulated does not entail assurance that the regulator will provide compensation to  
399 investors as the risks materialize, through higher ROEs and/or assurance of return of  
400 capital. If the utility is losing customers and throughput, competitive limits on regulated  
401 prices may constrain a utility's ability to earn higher returns or recover the invested  
402 capital when the risk materializes. Further, utility assets are long-lived. No regulatory  
403 panel can bind its successors and thus guarantee that investors will be compensated in the  
404 future for risks as they materialize.

405

406 Further, despite Dr. Booth's view that regulation is not a risk but a protective factor (page  
407 27), the March 30, 2012 rating action by S&P that changed the Outlook on NSPI from  
408 "Stable" to "Negative", cited a meaningful capital expenditure program to address

409 provincial and federal energy policies, driving the need for rate increases, which  
410 heightens regulatory risk.<sup>17</sup>

411

412 **Q. Dr. Booth points to PNG as an example of a utility where regulation helped the**  
413 **utility cope with fundamental business risk. Did the regulatory support of the**  
414 **BCUC eliminate the long-term fundamental business risks of the utility?**

415

416 A. No. As of its last DBRS rating report (June 2011), PNG was rated BBB(low), barely  
417 investment grade. As challenges to PNG, DBRS cited weak economic conditions in  
418 PNG's western system (where it had lost not only Methanex,<sup>18</sup> the major industrial  
419 customer to which Dr. Booth referred, but also major pulp and paper customers),  
420 competitive conditions of natural gas versus electricity and a low ROE for its business  
421 risk profile. In regard to the last, PNG's allowed ROEs for its three divisions were in the  
422 range of 9.9% to 10.15% on equity ratios of 40% to 45%.

423

424 **Q. Dr. Booth considers that it is the adoption of the FAM that makes NSPI comparable**  
425 **to Gaz Métro and Union Gas. He essentially bases this on his conclusions that the**  
426 **FAM operates in much the same way as purchased gas variance accounts (PGVAs)**  
427 **for gas distributors (page 5). Please respond.**

428

429 A. With respect to the FAM versus the PGVAs, the latter have operated to recover  
430 commodity costs not only in a timelier manner, but in a less contentious manner. In  
431 addition, with particular regard to Gaz Métro, as characterized by Dr. Booth, it has an  
432 "abundance of deferral accounts"<sup>19</sup> in addition to the PGVA, which itself includes not  
433 only gas commodity costs, but also pipeline transportation and gas storage cost. Among  
434 Gaz Metro's abundance of deferral accounts are accounts for gas usage, referenced by

---

<sup>17</sup> Standard & Poor's, *Research Update: Nova Scotia Power Inc. Outlook to Negative From Stable On Growth Plan Stresses; 'BBB+' Ratings Affirmed*, March 30, 2012.

<sup>18</sup> In the 1994 BCUC decision to which Dr. Booth refers to in response to NSPI (Booth)-7, the BCUC references Dr. Booth and Berkowitz's testimony with respect to PNG, specifically that the witnesses suggested that the risks associated with the concentrated industrial base and in particular the reliance on four industrial customers were offset by the bright outlook for Methanex (page 34).

<sup>19</sup> "Fair Return and Capital Structure for Gaz Metro, Evidence of Laurence D. Booth", July 2011, Appendix C, page 16.

435 Dr. Booth at page 32, as well as accounts for variations in short-term interest rates, bad  
 436 debt expense, income taxes, contributions to Québec's Green Fund, self-insurance, and  
 437 severance pay.<sup>20</sup> NSPI does not operate with the extensive suite of deferral accounts that  
 438 Gaz Métro does. Moreover, Dr. Booth considers that Gaz Metro's performance based  
 439 regulation acts as an offset to its business risk.<sup>21</sup> NSPI is not operating under a  
 440 performance based regulation plan.

441

442 **Q. In selecting Canadian gas utilities that he views as of comparable risk to NSPI, Dr.**  
 443 **Booth references Gaz Metro's and Union Gas' industrial load. Does Dr. Booth**  
 444 **appear to attribute any material significance to the customer base in either his risk**  
 445 **assessment or his recommendations?**

446

447 A. No. Although Dr. Booth relies on Union Gas and Gaz Métro as comparables to NSPI due  
 448 to their industrial load, it is not at all clear why, as Dr. Booth appears to attribute little or  
 449 no significance to either load composition or the economic base of the service area. He  
 450 also considers Enbridge Gas to be comparable to both Union Gas and NSPI (page 33),  
 451 despite the fact that he describes Enbridge Gas as a "premier low risk Canadian utility",  
 452 which operates in "traditionally the richest, most diversified area in Canada with  
 453 predominantly residential load..."<sup>22</sup>

454

455 **Q. Do the debt rating agencies consider load composition and the economic base of the**  
 456 **service area in their business risk assessments?**

457

458 A. Yes. DBRS, for example, considers the nature of the service area to be a critical business  
 459 risk factor. According to DBRS, a franchise area which has minimal load growth, is  
 460 economically stagnant, and has a balanced residential, commercial and industrial mix  
 461 equates to an "Adequate" or BBB rating on that factor. A franchise area with consistent  
 462 load declines, an economically weak service territory and customer mix weighted toward

<sup>20</sup> Cause tarifaire 2012, R-3752-2011, Réponse De Gaz Métro À Une Demande De Renseignements Association des consommateurs industriels de gaz (Bernard Otis), Question 1.4.

<sup>21</sup> Booth, *Ibid.*, page 4.

<sup>22</sup> "Business Risk and Capital Structure [sic] for Enbridge Gas Distribution INC. (EGDI), EB-2011-0354, Evidence of Laurence D. Booth", August 2012, pages 2 and 44.

463 cyclical industrials is considered “Weak”, or equivalent to a BB rating on that factor.<sup>23</sup>  
 464 Moody’s takes into account the extent of reliance on industrial customers and whether  
 465 they are in defensive or cyclical industries in its assessment of a utility’s diversification,  
 466 which is one of its designated debt rating factors.<sup>24</sup> S&P takes account of the health and  
 467 growth in the economy, growth in the population and the residential/commercial base and  
 468 the attractiveness of the service area’s business environment.<sup>25</sup>

469

470 **Q. Dr. Booth suggests that NSPI’s lost industrial load reflects a decline in business risk**  
 471 **(page 30). Do you agree?**

472

473 A. No, as I stated in response to NSPI (Booth)-9, “Not only does there remain considerable  
 474 uncertainty surrounding NS Power’s pulp and paper related load and the impact on the  
 475 utility, Ms. McShane considers that lost load and revenue from pulp and paper customers  
 476 would be a crystallization of a risk, rather than a reduction in risk that would translate  
 477 into a lower investor return requirement.”

478

479 **Q. Does Dr. Booth’s assessment that NSPI is comparable to Canadian gas distributors**  
 480 **overlook any significant differences between the two?**

481

482 A. Yes. Dr. Booth ignores fundamental business risk differences between gas (as well as  
 483 electricity) distributors and vertically integrated electric utilities, including NSPI.

484

485 1. Vertically integrated utilities have the obligation to build, lease or contract for  
 486 power to serve their customers. The construction of base load generation  
 487 frequently has long lead times, the potential deferral of the recovery of significant  
 488 financing costs until the plant goes into service, the risk that the market may not  
 489 have materialized when the plant is complete, and the risk that construction costs  
 490 may be disallowed. Distribution utilities do not face these risks.

---

<sup>23</sup> DBRS, *Methodology, Rating Companies in the North American Energy Utilities (Electric and Natural Gas) Industry*, May 2011.

<sup>24</sup> Moody's, *Global Infrastructure Finance: Regulated Electric and Gas Utilities*, August 2009.

<sup>25</sup> S&P, *Criteria/Corporates/Utilities: Key Credit Factors: Business and Financial Risks in the Investor-Owned Utilities Industry*, November 2008.

491

492 2. If generating plants are not operating, costs of obtaining replacement power may  
493 be borne by shareholders. Distribution utilities do not face the same risk.

494

495 3. Generating plants, particularly fossil fuel plants, are more likely to be substituted  
496 with, or bypassed by, a lower cost alternative power source or subjected to a  
497 competitive market than a distribution system.

498

499 4. Vertically integrated electric utilities that generate the preponderance of the power  
500 sold to its native load) typically have close to 50% of their rate base invested in  
501 generation plant, which is inherently more risky from an operational standpoint  
502 than distribution or transmission assets. The extent to which that is the case  
503 depends on the technologies (hydroelectric, fossil fuel, nuclear) used.

504

505 5. Fossil fuel generating capacity is subject to higher environmental risks than  
506 distribution systems.

507

508 **Q. Is there any evidence that the debt rating agencies consider a vertically integrated**  
509 **electric utility with generation operations to face more business risk than wires or**  
510 **pipes utilities?**

511

512 A. Yes. In its November 2008 *Key Credit Factors: Business And Financial Risks In The*  
513 *Investor-Owned Utilities Industry*, S&P stated that “We view a company that owns  
514 regulated generation, transmission, and distribution operations as positioned between  
515 companies with relatively low-risk transmission and distribution operations and  
516 companies with higher-risk diversified activities on the business profile spectrum.”  
517 DBRS considers utilities that are entirely regulated and largely wires utilities, i.e.,  
518 primarily electric transmission and distribution with modest, if any power generation, to  
519 have lower business risk than integrated electric utilities with very timely and certain fuel  
520 recovery.<sup>26</sup> According to Moody’s “Vertically integrated electric utilities are generally

---

<sup>26</sup> DBRS, *Ibid.*

521 considered to have higher business risk than T&D utilities due to the risks associated with  
 522 generation including fuel price and volume, operational and environmental risks. Among  
 523 utilities with generation, those with significant exposure to fossil fuels, particularly coal,  
 524 are typically viewed as having higher risk due to uncertainty as to the timing and amount  
 525 of capital expenditures required to comply with further anticipated restrictions on  
 526 environmental emissions including carbon dioxide, mercury, sulfur dioxide and nitrogen  
 527 oxides.”<sup>27</sup>

528  
 529 NSPI is a prime example of a utility with significant exposure to fossil fuels, with the  
 530 added risks and complexities of addressing its renewable energy resource requirements  
 531 resulting from provincial energy policy while operating in an uncertain economic  
 532 environment.

533

534 **Q. On the basis of the discussion above, what conclusions can be drawn?**

535

536 A. Dr. Booth underestimates NSPI’s business risk; his position that NSPI is comparable in  
 537 risk to gas distribution utilities ignores the fundamentally higher business risks of NSPI,  
 538 which are not offset by a higher common equity ratio. In fact, NSPI’s common equity  
 539 ratio is lower than average. As a result, his conclusion that an ROE applicable to an  
 540 average risk (or “benchmark”) utility would be applicable to NSPI is doubly flawed.

541

542 **C. CAPITAL ASSET PRICING MODEL**

543

544 **Q. Dr. Booth’s recommendations of ROEs for NSPI of 7.50% and 8.50% for 2013 and**  
 545 **2014 respectively are based virtually exclusively on his application of the Capital**  
 546 **Asset Pricing Model (CAPM). Is this a reasonable approach, in your view?**

547

548 A. No. The challenges associated with the CAPM are of a sufficient magnitude to warrant  
 549 the conclusion that it is not inherently superior to other approaches to the estimation of a

---

<sup>27</sup> Moody's, *Regulatory Frameworks - Ratings and Credit Quality for Investor-Owned Utilities, Evaluating a Utility's Regulatory Framework*, June 2010.

550 fair return, particularly in light of the adjustments to the theoretical CAPM necessary to  
 551 apply it to the utility industry. Any individual cost of equity model implicitly ascribes  
 552 simplicity to a cost whose determination is inherently complex. No single model is  
 553 powerful enough on its own to produce “the number” that will meet the fair return  
 554 standard. Only by applying a range of tests along with informed judgment can adherence  
 555 to the fair return standard be ensured, where the fair return standard includes the  
 556 comparable returns requirement, as well as the maintenance of financial integrity and the  
 557 ability to attract capital.

558

559 **Q. Dr. Booth refers to several 2009 Canadian cost of capital decisions which relied on**  
 560 **the CAPM in arriving at the allowed ROE. What inferences can you draw from**  
 561 **them?**

562

563 A. First, with the exception of the Newfoundland Power decision<sup>28</sup> (cited at page 69 of Dr.  
 564 Booth’s testimony), none of them relied solely on the CAPM. The two that started with  
 565 the CAPM as the base (the Régie for Gaz Métro<sup>29</sup> cited at page 68 and the AUC for the  
 566 Alberta Utilities<sup>30</sup> cited at page 69) made significant adjustments to the CAPM results to  
 567 arrive at the final allowed ROE. In setting the allowed ROE for Gaz Métro at 9.2%, the  
 568 Régie adjusted its estimate of the CAPM ROE for a benchmark distributor by 1.14% to  
 569 1.92% for a combination of Gaz Métro’s higher risk relative to a benchmark distributor,  
 570 the financial crisis and other tests. The AUC’s allowed ROE of 9.0% was 1.2% higher  
 571 than the mid-point of its CAPM range.<sup>31</sup>

572

<sup>28</sup> Newfoundland and Labrador Board of Commissioners of Public Utilities, *Reasons for Decision: Order No. P.U. 43(2009)*, December 24, 2009.

<sup>29</sup> Régie de l’Énergie, *Décision Demande de modifier les tarifs de Société en commandite Gaz Métro à compter du 1<sup>er</sup> octobre 2009, D-2009-156, R-3690*, 7 Decembre 2009.

<sup>30</sup> Alberta Utilities Commission, *2009 Generic Cost of Capital Decision 2009-216*, November 12, 2009.

<sup>31</sup> It bears noting that Dr. Booth’s own recommendations in this proceeding entail significant judgmental adjustments to his CAPM estimates. Moreover, his recommended benchmark utility ROEs of 7.50% and 8.50% at long-term Government of Canada bond yields of 3.0% and 4.0% respectively are both **higher** than the recommendation he made for a benchmark utility in the 2009 Alberta Generic Cost of Capital proceeding (during the financial crisis) of 7.25% at a forecast long-term Government of Canada bond yield of 4.25%.

573 **Q. What about the BCUC decision<sup>32</sup> which Dr. Booth cites at pages 69-70?**

574

575 A. Dr. Booth references the BCUC CAPM result of 7.30% to 8.30%, but he does not  
576 provide a complete picture of the BCUC conclusions regarding the fair return for the  
577 benchmark BC utility. Dr. Booth fails to note that the BCUC set the allowed ROE for the  
578 benchmark BC utility at 9.50% and had the following to say with respect to CAPM:

579

580 CAPM is based on a theory that can neither be proved nor disproved, relies on a  
581 market risk premium which looks back over nine decades and depends on a  
582 relative risk factor or beta. The fact that the calculated beta for PNG (considered  
583 by Dr. Booth to be the most risky utility in Canada) was 0.26 in 2008 causes the  
584 Commission Panel to consider that betas conventionally calculated with reference  
585 to the S&P/TSX are distorted and require adjustment.

586

587 The Commission Panel will give weight to the CAPM approach, but considers  
588 that the relative risk factor should be adjusted in a manner consistent with the  
589 practice generally followed by analysts so that it yields a result that accords with  
590 common sense and is not patently absurd.

591 **Q. Has Dr. Booth omitted any major 2009 Canadian cost of capital reviews in his  
592 discussion of regulators' application of CAPM?**

593 A. Yes, Dr. Booth did not mention the OEB's cost of capital review,<sup>33</sup> which stated as  
594 follows.

595 The Board's current formulaic approach for determining ROE is a modified  
596 Capital Asset Pricing Model methodology, and in his written comments, Dr.  
597 Booth recommended that this practice be continued. Dr. Booth recommended that  
598 "the Board base its fair ROE on a risk based opportunity cost model, with  
599 overwhelming weight placed on a CAPM estimate.

600

601 This view was not shared by other participants in the consultation, who asserted  
602 that the Board should use a wide variety of empirical tests to determine the initial  
603 cost of equity, deriving the initial ERP [equity risk premium] directly by  
604 examining the relationship between bond yields and equity returns, and indirectly

---

<sup>32</sup> British Columbia Utilities Commission, *In the Matter of Terasen Gas Inc. Terasen Gas (Vancouver Island) Inc. Terasen Gas (Whistler) Inc. and Return on Equity and Capital Structure Decision*, December 16, 2009 ("BCUC 2009 Cost of Capital Decision").

<sup>33</sup> Ontario Energy Board, *Report of the Board on the Cost of Capital for Ontario's Regulated Utilities, EB-2009-0084*, December 11, 2009 ("OEB 2009 Cost of Capital Report").

605 by backing out the implied ERP by deducting forward-looking bond yields from  
606 ROE estimates...

607  
608 The Board agrees that **the use of multiple tests to directly and indirectly**  
609 **estimate the ERP is a superior approach to informing its judgment than**  
610 **reliance on a single methodology.** [emphasis in original] In particular, the Board  
611 is concerned that CAPM, as applied by Dr. Booth, does not adequately capture the  
612 inverse relationship between the ERP and the long Canada bond yield. As such,  
613 the Board does not accept the recommendation that it place overwhelming weight  
614 on a CAPM estimate in the determination of the initial ERP. (pages 34-36)

615

616 In its 2009 Cost of Capital report, the OEB set the benchmark allowed ROE at 9.75%,  
617 based on a long-term Canada bond yield of 4.25% and a spread between long-term A  
618 rated utility and Government of Canada bond yields of 1.415%.<sup>34</sup> At Dr. Booth's 3.5%  
619 30-year Government of Canada bond yield forecast during NSPI's test period, the OEB  
620 automatic adjustment formula indicates an allowed ROE of approximately 9.4%, higher  
621 than NSPI's requested 9.2%, and for lower risk distribution utilities.

622

623 **Q. Is it your view that the CAPM is not inherently superior to other tests and should**  
624 **not be used as the sole, or even the primary, test to set the allowed ROE?**

625

626 A. Yes. The CAPM is intended to estimate what investors should require if the assumptions  
627 of the model hold. It does not measure the returns that are actually available to investors.  
628 Consequently, in principle, it does not measure comparable investment returns, which is a  
629 requirement of the fair return standard.

630

631 Even the "father" of Modern Portfolio Theory, Dr. Harry Markowitz has taken issue with  
632 the CAPM. Dr. Markowitz has stated that "The CAPM is a thing of beauty. Thanks to  
633 one or another counterfactual assumption, it achieves clean and simple conclusions."<sup>35</sup> A  
634 key counter-factual assumption is the investor's ability to borrow unlimited amounts at  
635 the risk-free rate. He concludes that because key assumptions of the model do not hold,

<sup>34</sup> *Ibid.*, Appendix B.

<sup>35</sup> Markowitz, Harry M., "Market Efficiency: A Theoretical Distinction and So What?", *Financial Analysts Journal*, September/October 2005, page 29.

636 then it no longer holds that expected returns are linearly related to beta. He does state  
637 that CAPM should be taught, despite its drawbacks.

638

639 It is like studying the motion of objects on Earth under the assumption that the  
640 Earth has no air. The calculations and results are much simpler if this assumption  
641 is made. But at some point, the obvious fact that, on Earth, cannonballs and  
642 feathers do not fall at the same rate should be noted and explained to some  
643 extent.<sup>36</sup>

644

645 The well-known Fama French study<sup>37</sup> of the CAPM concluded:

646

647 The attraction of the CAPM is that it offers powerful and intuitively pleasing  
648 predictions about how to measure risk and the relation between expected return  
649 and risk. Unfortunately, the empirical record of the model is poor – poor enough  
650 to invalidate the way it is used in applications. The CAPM’s empirical problems  
651 may reflect theoretical failings, the result of many simplifying assumptions. But  
652 they may also be caused by difficulties in implementing valid tests of the model...  
653 In the end, we argue that whether the model’s problems reflect weaknesses in the  
654 theory or in its empirical implementation, the failure of the CAPM in empirical  
655 tests implies that most applications of the model are invalid.

656

657 In a May 2009 survey, “Betas Used by Professors: A Survey with 2,500 Answers,” Dr.  
658 Pablo Fernandez (the same professor whose market risk premium survey Dr. Booth  
659 references at page 66 of his testimony) cites nine different problems with one of the three  
660 inputs to the CAPM, beta. These problems include: (1) they have little correlation with  
661 stock returns; (2) a beta of 1.0 has a higher correlation with stock returns for many  
662 companies; (3) frequently we don’t know if the beta of one company is higher than  
663 another; (4) the correlation coefficients of the regressions used to calculate the betas are  
664 very small; (5) and the relative magnitude of betas often makes very little sense. Based  
665 on the issues cited, Dr. Fernandez reaches two findings: the beta calculated with  
666 historical data is not a good approximation to the company’s beta and the beta of a

---

<sup>36</sup> *Ibid.*, pages 28-29.

<sup>37</sup> Fama, Eugene and Kenneth French, “The CAPM: Theory and Evidence”, *Journal of Economic Perspectives*, Volume 18, Number 3 (Summer 2004).

667 company (a common figure for all investors) does not exist. The two conclusions, Dr.  
668 Fernandez states, imply the CAPM does not work. Ultimately, Dr. Fernandez concludes:

669 We argue, as many professors mention, that historical betas (calculated from  
670 historical data) are useless to calculate the required return to equity (footnote  
671 omitted), to rank portfolios with respect to systematic risk, and to estimate the  
672 expected return of companies.  
673

674

675 **Q. At page 64, Dr. Booth points to the high percentage of corporate CFOs who use**  
676 **CAPM to estimate their cost of capital. Does this finding provide any assurance**  
677 **that calculations of the CAPM cost of equity produce reasonable estimates of a fair**  
678 **ROE?**

679

680 A. No. Unregulated firms other than utilities use their estimated cost of equity largely for  
681 capital budgeting purposes. Corporations will not undertake projects unless the expected  
682 rate of return on the project exceeds the estimated cost of capital. Unregulated firms have  
683 significant flexibility to make adjustments to simplistic CAPM estimates if and when the  
684 calculations do not appear to be reasonable. What Dr. Booth does not mention is that,  
685 while a high proportion of companies use CAPM to estimate their cost of capital, the  
686 hurdle rates that they use for capital budgeting tend to exceed their corporate weighted  
687 average costs of capital by a large margin.

688

689 The results of a survey published in 2011 found that what the authors referred to as  
690 corporations' "actual" weighted average cost of capital (WACC), i.e., what the authors  
691 thought the WACC should be based on their estimates of CAPM based cost of capital,  
692 only accounted for approximately one-half of the hurdle rate used by corporations. (In  
693 other words, the actual hurdle rates used by corporations were close to twice the authors'  
694 CAPM based WACC estimates). The survey found that the mean and median nominal  
695 hurdle rates that had been used by the surveyed corporations over the prior two years for  
696 a typical project were, respectively, 14.1% and 14.0% for firms that used a WACC

697 equivalent hurdle rate.<sup>38</sup> The corresponding risk-free rate at the time the survey was  
 698 conducted was estimated as the yield on 10-year Treasury bonds, which was 4.3%.<sup>39</sup> Of  
 699 the corporations surveyed, over 70% of the respondents stated that the hurdle rate is their  
 700 WACC. The analysis also showed that the firms' CAPM cost of equity explained only  
 701 about 10% of the variation among the hurdle rates used by the corporations.<sup>40</sup> One  
 702 reasonable interpretation of the observed difference between the hurdle rates that  
 703 corporations use in their capital budgeting versus what they estimate as their CAPM cost  
 704 of equity is that corporations are not investing in a portfolio of securities, they are  
 705 investing in irreversible projects that comprise long-term assets.<sup>41</sup> Those projects can be  
 706 extremely large and their performance can significantly impact the performance of the  
 707 firm.

708

709 **Q. Is the application of the CAPM particularly problematic in current financial market**  
 710 **conditions?**

711

712 A. Yes. Long-term government bond yields are abnormally low at present, largely due to a  
 713 confluence of factors including weak economic conditions, the Bank of Canada's  
 714 decisions to maintain its overnight rate at historically low levels, investor flight to  
 715 quality, i.e., away from riskier assets including equities, and a decreasing global pool of  
 716 safe haven assets. The low level of long-term Government of Canada bond yields has  
 717 little, if any, correlation with trends in the market cost of equity.<sup>42</sup>

---

<sup>38</sup> For all respondents, including those who did not use a WACC equivalent discount rate, the mean and medians were 14.8% and 15.0% respectively. The corresponding mean real hurdle rate was 12.3%.

<sup>39</sup> The survey was conducted in 2003.

<sup>40</sup> Jagganathan, Ravi, Iwan Meier, and Vefa Tarhan, "The Cross-Section of Hurdle Rates for Capital Budgeting: An Empirical Analysis of Survey Data", *National Bureau of Economic Research Working Paper* No. 16770, February 2011. Equity risk premium surveys of CFOs that are conducted by annually by Drs. Graham and Harvey, an article of whom Dr. Booth cites at page 63, document that, while the majority of corporations use CAPM, their market risk premium is "supplemented" so that their hurdle rate exceeds the expected excess return on the S&P 500.

<sup>41</sup> The authors posit that the difference in the hurdle rates and the WACC reflects the availability of valuable alternative investment opportunities, i.e., the hurdle premium reflects the option to wait for better investment opportunities.

<sup>42</sup> In its March 2012 *Equity Gilt Study*, Barclays Capital stated:

Our analysis suggests that current equity prices are consistent with future returns that are not far from historic norms. By contrast, rates of returns on risk-free assets stand out as abnormally low, as they are currently negative on an inflation adjusted basis in nearly all cases. An important reason for these low

718

719 **Q. Can you provide some perspective on how much higher the market equity risk**  
 720 **premium could be at Dr. Booth's forecast 2013-2014 3.5% average long-term**  
 721 **Government of Canada bond yield than the long-term experienced risk premium in**  
 722 **Canada?**

723

724 A. Yes. Over the long-term (1924-2011), the average achieved market risk premium was  
 725 5.4%, reflecting an average equity market return of 11.4% and a bond income return<sup>43</sup> of  
 726 6.0%. The latter is 2.5 percentage points higher than Dr. Booth's forecast long-term  
 727 Canada bond yield of 3.5% over the two-year test period. Table 1 below shows that  
 728 except at the lowest levels of long-term Government of Canada bond income returns,  
 729 average equity returns have been broadly in the range of approximately 11.0% to 12.5%  
 730 during the two periods. At bond income returns below 8% (average of approximately  
 731 4.5%), the corresponding equity risk premium averaged approximately 7.25%. Only  
 732 when the highest levels of bond income returns are included do the average achieved  
 733 equity risk premiums drop to approximately 6.0% and then to approximately 5.5%. In  
 734 other words, the historical data indicate that the equity risk premium has varied with bond  
 735 yields, i.e., higher risk premiums at lower levels of bond yields and vice versa. At the  
 736 level of long-term Government of Canada bond yields forecast by Dr. Booth for the test  
 737 period, the average achieved equity risk premium was close to 9.0%, compared to the  
 738 range of 5.0% to 6.0% that Dr. Booth uses in his CAPM calculations.

739

740

---

yields is the structural decrease in the supply of risk-free assets that is not likely to be corrected in the next few years. The implication is that equity risk premia - the difference between the expected yields on equities and risk free assets - are likely to remain historically high even if cyclical factors could lead them to reverse somewhat over the next few years. (page 4)

Barclays concluded that equity risk premia "are meaningfully higher than historical experience." (page 6)

<sup>43</sup> The bond income return reflects only the coupon payment portion of the total bond return. As such, the income return represents the riskless component of the total government bond return. The bond income return is similar to the bond yield. The bond total return includes annual capital gains or losses and reinvestment of the bond coupons. In principle, using the bond income return in the calculation of historical risk premiums more accurately measures the historical equity risk premium above a true risk-free rate.

741

Alternatively, the expected market equity rate of return and equity risk premium can be estimated from historical returns and their relationship to inflation. The expected return on equity should be equal to the sum of the real risk-free cost of capital, the expected rate of inflation and an equity risk premium. Historically, on average, the actual rate of consumer price (CPI) inflation in Canada was higher than the rate of inflation currently forecast to prevail over the longer term. The arithmetic average CPI rate of inflation from 1926-2011 in Canada was 3.0%; the most recent consensus long-term (2013-2022) forecast of CPI inflation is 2.0%.<sup>44</sup> The lower forecast rate of inflation compared to the historical rate of inflation might suggest that expected nominal equity returns would be lower than they have been historically. However, an analysis of nominal equity returns, rates of inflation and real returns on equity shows that real equity returns have generally been higher when inflation was lower. Table 2 below summarizes the nominal and real rates of equity market returns historically at different levels of CPI inflation.

780

781

The observed negative relationship between the real equity return and the rate of inflation does not support a reduction to the historic nominal equity rates of return for expected lower inflation for the purpose of estimating the future equity risk premium. It also bears noting that, while the average real equity return in Canada over the longer period was 8.4%, the average is materially affected by the inclusion of high inflation years. When years in which inflation exceeded 10% are excluded (seven of 88 observations), the average real equity return is a full percentage point higher, i.e., 9.4%. The corresponding average rate of CPI inflation was 2.3%, similar to the forecast rate of inflation. The average real equity return is similar, at approximately 9.5%, when the years in which inflation exceeded 10% and the same number of abnormally low inflation years (average of -4.1%) are removed. At a real equity return of 9.5% and an inflation rate of 2.0%, the indicated nominal equity return is approximately 11.5%. At a nominal equity return of 11.5%, the market equity risk premium at Dr. Booth's forecast 3.0%-4.0% long-term Canada bond yield is 7.5% to 8.5%.

The two analyses above support a market risk premium of no less than 8.0% at Dr. Booth's forecast long-term Canada bond yield.

782 **Q. How do you reconcile these results with the results of the most recent (2012)**  
 783 **Fernandez survey that Dr. Booth cites (page 12), which shows that the median**  
 784 **market risk premium estimate of analysts, professors and companies for Canada**  
 785 **was 5.5%?**

786  
 787 A. Surveys of market risk premiums are problematic for several reasons. First, there appears  
 788 to be a significant amount of circularity in the results. Of the 1650+ responses to the  
 789 2102 Fernandez survey that provided the source of their estimates, close to 85% of the  
 790 respondents appear to use other published sources, rather than their own estimates.<sup>45</sup>  
 791 Second, it is not clear with what risk-free rate the survey market risk premium estimates  
 792 are intended to be applicable. In the 2009 generic cost of capital proceeding before the  
 793 Alberta Utilities Commission, Dr. Booth was asked to define the market equity risk  
 794 premium, and responded that “As used by most expert witnesses before the AUC the  
 795 equity market risk premium is the difference between the long run equity and long run  
 796 government bond return.”<sup>46</sup> The 2013-2014 forecasts of long-term Government of  
 797 Canada bond yields are materially lower than either their long-term historical average or  
 798 the forecast long-run average.<sup>47</sup> The survey does not specify whether, when they use  
 799 their reported estimates of the equity market risk premium, respondents use them in  
 800 conjunction with a long-run average risk-free rate or whether they make adjustments they  
 801 to the estimated market risk premium to account for differences between the long-run  
 802 average and prevailing risk-free rates. Third, the survey does not specify what other  
 803 adjustments respondents might make if they are using their estimate of the market risk  
 804 premium to derive a cost of equity for a particular company.<sup>48</sup>

---

<sup>45</sup> Fernandez, Pablo, Javier Aguirreamalloa and Luis Corres, *Market Risk Premium used in 82 countries in 2012: a survey with 7,192 answers*, page 10.

<sup>46</sup> Dr. Laurence Booth, Response to ATCO-CAPP-11(b), 2009 Generic Cost of Capital Proceeding, Application No. 1578571, ID 85, March 24, 2009.

<sup>47</sup> As shown in Table 1, the historical average long-term Government of Canada bond income return was 6.0%. The most recent long-term Consensus Economics, *Consensus Forecasts*, April 2012, indicates that, over the longer-term, the 30-year Government of Canada bond yield is expected to be approximately 5.0%.

<sup>48</sup> For example, analysts frequently make adjustments to the market equity risk premium for the size of the company, as the “market” is dominated by large capitalization stocks and empirical studies that have documented higher returns for smaller companies than predicted by the CAPM. To provide some perspective, using the U.S. equity market as an illustration, such adjustments for size could range from approximately one percentage point for a mid-cap equity to over six percentage points for micro-capitalization equities (Ibbotson, *S&P 2012 Valuation Yearbook Market Results for Stocks, Bonds, Bills, and Inflation 1926-2011*, pages 89-95).

805

806 **Q. Dr. Booth uses a beta of approximately 0.50 to adjust his equity market risk**  
807 **premium to derive his estimate of the benchmark utility risk premium. Please**  
808 **comment on the reasonableness of his downward adjustment.**

809

810 A. The 0.50 downward adjustment made by Dr. Booth is based largely on the long-term  
811 correlation between utility share price movements and share price movements in the TSX  
812 and his judgment. However the correlation in share price movements bears no  
813 relationship to the actual relationship between actual market returns for utilities and  
814 returns for the market as a whole. Over the long-term, the market returns over long-term  
815 Canada bonds that investors have achieved in utility shares in both Canada and the U.S.  
816 have been higher than 50% of the achieved equity market risk premiums. That  
817 experience is consistent with the empirical evidence that lower (higher) beta stocks  
818 generally have achieved higher (lower) returns than the CAPM and beta would have  
819 predicted. The objective of the CAPM is an estimate of the returns that investors expect  
820 or require. Using a beta or relative risk adjustment of 0.50 for a benchmark utility will  
821 understate that return.

822

823 **Q. Dr. Booth claims (page 65) that using a long-term risk-free rate rather than the**  
824 **short-term interest rates in the CAPM adjusts for the bias in the tests of the CAPM**  
825 **that showed lower beta stocks earned higher returns than the CAPM predicted.**  
826 **Please comment.**

827

828 A. Applying the model using a long-term rather than the short-term risk-free rate that has  
829 typically been used in empirical studies of the CAPM does adjust somewhat for the flatter  
830 relationship observed between beta and average return. However, Dr. Booth presents no  
831 evidence that suggests using a long-term rate rather than a short-term risk-free rate fully  
832 adjusts for the bias.

833

834 The Fama French study of the CAPM (referenced above) found, based on analysis  
835 covering 1928 to 2003 for the U.S. market, the predicted return on the lowest beta stock

836 portfolio was 2.8 percentage points lower than the actual return. As illustrated below, the  
 837 results of this study suggest that using a long-term risk-free rate rather than a short-term  
 838 rate does not come close to close to capturing the observed difference between the  
 839 predicted and actual returns for low beta portfolios generally or for utility stocks in  
 840 Canada and the U.S. specifically.

841  
 842 At page 65, Dr. Booth references a spread (or maturity premium) in Canada between  
 843 Treasury bill and long-term Canada bond yields. Assume, illustratively, that over the  
 844 long-run, the long-term Canada bond yield is 5.0%, the Treasury bill rate is 3.75% (i.e.,  
 845 1.25% lower), and the market return is 10.5% (equal to a long-run market risk premium  
 846 of 5.5% plus the 5.0% long-term Canada bond yield) and the “raw” beta of a utility  
 847 portfolio is 0.50. Using the short-term rate as the risk-free rate produces a CAPM return  
 848 of 7.125% ( $3.75\% + 0.50 (10.5\% - 3.75\%)$ ). When a long-term Government of Canada  
 849 bond yield of 5.0% is used as the risk-free rate, the CAPM return is equal to 7.75% ( $5.0\%$   
 850  $+ 0.50 (10.5\% - 5.0\%)$ ). Replacing the short-term Treasury bill rate with the long-term  
 851 government bond yield adjusts the cost of equity of a stock with a 0.50 “raw” beta  
 852 upward by 0.625 percentage points, significantly less than the 2.8 percentage points  
 853 referenced in the Fama and French study.

- 854  
 855 **Q. Is it possible to demonstrate this using data specifically for Canadian utilities?**  
 856  
 857 **A.** Yes. A regression of the monthly returns on the TSX Utilities Index against the market  
 858 risk premium measured as the return on the TSX Composite less the risk-free rate as  
 859 proxied by 90-day Treasury bill returns over the period 1970-2011<sup>49</sup> shows the following:  
 860  
 861

---

<sup>49</sup> The Monthly TSX Utilities Index Returns are comprised of the monthly returns on the TSE Gas & Electric Index for the period January 1970 to April 2003 and the monthly returns on the S&P/TSX Utilities Index for the period May 2003 to December 2011.

862

**Table 3**

Monthly TSX Utilities Index Return	=	0.009 + 0.465	} Monthly TSX Composite Excess Return }

865

866

867

868

869

870

871

872

873

874

875

876 **Q. Dr. Booth states in Appendix C (page 11) that his calculation of betas is consistent**  
877 **with conventional practice. He compares utility betas published by three other**  
878 **sources to his own calculated betas, and notes that none of the three sources of betas**  
879 **does any adjustments to their calculations nor discusses any adjustments. Do these**  
880 **observations constitute evidence that unadjusted betas are appropriate for use in**  
881 **the application of the CAPM?**

882

883 A. No. The sources cited by Dr. Booth are simply providing calculations of historical  
884 regressions of percentage share price changes for specific companies on percentage  
885 changes in an equity market index. They are not prescribing the use of the resulting  
886 calculated betas to estimate the cost of equity. They make no claims that the historical

---

<sup>50</sup> The regression was performed using monthly data, so the intercept of 0.009 is equal to the monthly return on 90-day Treasury bills. The annualized return is equal to  $(1+0.009)^{12}-1.0 = 0.1085 = 10.85\%$ .

887 regression results they publish will produce a reasonable estimate of the cost of equity if  
888 utilized in the application of the CAPM.

889

890 **Q. Are you aware of any studies that indicate that adjusted betas do a better job of**  
891 **predicting returns than the calculated regression or “raw” betas, such as the ones**  
892 **cited by Dr. Booth in Appendix C?**

893

894 A. Yes. In an article released in May 2009 (“ $\beta = 1$  Does a Better Job than Calculated  
895 Betas”), the same Dr. Fernandez cited above and co-author, Vicente Bermejo find that  
896 adjusted betas (i.e., the Blume adjustment cited by Dr. Booth at page 8 of Appendix C,  
897 equal to  $0.67 \times$  calculated “raw” beta +  $0.33 \times$  Market Beta of 1.0) do a better job of  
898 predicting returns than the calculated beta. They also find that assuming a beta of 1.0  
899 (i.e., the market beta) does a better job than the adjusted beta.

900

901 **Q. Given the latter finding, would you recommend using a beta of 1.0 for utility stocks?**

902

903 A. No. I recommend using adjusted betas with the “Blume” formulation, used by a number  
904 of major publishers of betas, including *Value Line*, Bloomberg and Merrill Lynch, which  
905 balances the importance of reliance on a risk adjustment that reasonably predicts  
906 expected and required returns with the recognition that utility stocks are of lower than  
907 average (compared to the market) risk.

908

909 **Q. What have been the adjusted betas of the sample of electric utilities that you used as**  
910 **comparables for NSPI?**

911

912 A. As shown in Rebuttal Schedule 2, since the mid-1990s, the adjusted betas for the  
913 comparable electric utilities as reported by *Value Line*, have averaged approximately  
914 0.70.

915

916 **Q. Given Dr. Booth's forecast of long-term Canada bond yields, an estimate of the**  
 917 **market risk premium of 8.0% at that level of yields, and an adjusted beta of 0.70,**  
 918 **what is a reasonable estimate of the CAPM cost of equity for NSPI?**

919

920 A. The estimated CAPM cost of equity, including, as Dr. Booth does, an adjustment of  
 921 0.50% for financing flexibility, is 9.6%, higher than the 9.2% ROE that NSPI is  
 922 requesting.

923

924 **Q. How does the CAPM cost of equity compare to a more direct estimate of the**  
 925 **expected utility return on equity developed from historical utility market data?**

926

927 A. It is a conservative estimate. As shown in Table 4 below, over the longest term available  
 928 (1956-2011),<sup>51</sup> the average achieved utility (electric and gas combined) equity risk  
 929 premium in Canada was 4.8% in relation to bond income returns for long-term  
 930 Government of Canada bonds.<sup>52</sup> For U.S. electric utilities, the average historic utility  
 931 equity risk premium in relation to bond income returns over the entire post-World War II  
 932 period (1947-2011) was 5.1%. For U.S. gas utilities, the corresponding average historic  
 933 utility equity risk premium was and 6.0%.

934

935

**Table 4**

	<b>Utility Equity Returns</b>	<b>Bond Income Returns</b>	<b>Utility Risk Premium Relative To Bond Income Returns</b>
<b>Canadian Utilities</b>	12.1%	7.3%	4.8%
<b>U.S. Electric Utilities</b>	11.0%	5.9%	5.1%
<b>U.S. Gas Utilities</b>	11.9%	5.9%	6.0%

936

937

938

939

940

Source: [www.bankofcanada.ca](http://www.bankofcanada.ca); Canadian Institute of Actuaries, *Report on Canadian Economic Statistics 1924-2011*; [www.federalreserve.gov](http://www.federalreserve.gov); Ibbotson Associates, *Stocks, Bonds, Bills and Inflation: 2012 Yearbook*; [www.standardandpoors.com](http://www.standardandpoors.com); and *TSX Review*.

<sup>51</sup> The longest period for which Canadian utility index data are available from the Toronto Stock Exchange.

<sup>52</sup> Based on the Gas/Electric Index of the TSE 300 from 1956 to 1987 and on the S&P/TSX Utilities Index from 1988-2011.

941 As with the risk premiums for the market composite, the magnitude of achieved utility  
 942 equity risk premiums is a function of both the equity returns and the bond returns. An  
 943 analysis of the underlying data indicates there has been no secular upward or downward  
 944 trend in the utility equity returns. Trend lines fitted to the historic utility equity returns  
 945 for each of the three utility indices are flat. The historical average utility returns in both  
 946 Canada and the U.S. have clustered in the range of 11.0-12.0%. However, the achieved  
 947 government bond income returns in Canada over the period of analysis, at 7.3%, were  
 948 materially higher than Dr. Booth's 3.5% test period average forecast yield on 30-year  
 949 Government of Canada bonds.

950

951 A reasonable approach to interpreting the historical utility equity market return data is the  
 952 recognition of the inverse relationship between utility equity risk premiums and  
 953 government bond yields. Table 5 derives estimates of the utility equity risk premium for  
 954 the longer term from the historical average risk premiums by applying a 50% sensitivity  
 955 factor to the difference between the historical average bond income returns and the  
 956 forecast Government of Canada bond yield forecast.<sup>53</sup>

957

959

960

961

<sup>53</sup> The 50% sensitivity factor with the sensitivity factor on long-term Government bonds utilized in the automatic adjustment formula adopted by the OEB in 2009, which, in turn, was based on the empirical evidence filed with the OEB in its 2009 cost of capital consultation, as discussed at pages 20-21 of my direct evidence.

962 At Dr. Booth's forecast 3.5% 30-year Government of Canada bond yield and a 50%  
 963 sensitivity factor between utility equity risk premiums and long-term government bond  
 964 yields, the indicated utility equity risk premium derived from historical averages is in the  
 965 approximate range of 6.25% to 7.25% (mid-point of estimates of approximately 6.75%).  
 966 The corresponding utility cost of equity, is in the range of approximately 9.75% to  
 967 10.75%, higher than the 9.2% ROE requested by NSPI, even before any adjustment for  
 968 financing flexibility.

969

970 **D. DISCOUNTED CASH FLOW TEST**

971

972 **Q. Dr. Booth effectively dismisses the discounted cash flow (DCF) test applied to**  
 973 **utilities (Appendix D, page 13-16), and claims that DCF estimates are unreliable**  
 974 **when estimated from analysts' growth rates that are known to be biased (page 78**  
 975 **and Appendix D, pages 14-16). Please address.**

976

977 A. At the outset, I would point out that Dr. Booth's position on the importance of the DCF  
 978 test applied to utilities is at odds with the perspectives of the experts who gave evidence  
 979 on the cost of equity in NSPI's 2012 GRA. Although the four experts, including myself,  
 980 who filed evidence with the Board gave different weights to the DCF test applied to  
 981 utilities, ranging from preponderant weight to approximately one-third weight, all four  
 982 experts agreed that the DCF test is an important methodology for the estimation of a fair  
 983 return on equity for a utility.

984

985 I would also note that in the BCUC 2009 Cost of Capital Decision,<sup>54</sup> the BCUC found  
 986 that "As for the two most commonly used approaches [CAPM and DCF], the  
 987 Commission Panel finds that the DCF approach has the more appeal in that it is based on  
 988 a sound theoretical base, it is forward looking and can be utility specific." In its 2009

---

<sup>54</sup> BCUC, 2009 *Cost of Capital Decision*, page 45.

989 Cost of Capital Report, the OEB implicitly gave significant weight to the DCF test in  
990 arriving at its benchmark utility cost of equity.<sup>55</sup>

991  
992 In addition, the DCF test applied to utilities is one of the principal tests employed by U.S.  
993 regulators, both federal and state, to estimate the fair ROE. While utility cost of capital  
994 experts in the U.S. routinely take the position that the DCF test, like other tests, has its  
995 own set of “warts” and is not inherently superior to other tests (and thus should be used  
996 exclusively), I am not aware of any expert who has taken the position that it should be  
997 disregarded.

998  
999 With respect to Dr. Booth’s reference to analysts’ forecasts that “are known to be  
1000 biased”, I acknowledge that there have been studies that have concluded that analysts’  
1001 earnings forecasts have tended to be optimistic. Analyst optimism became a high profile  
1002 issue during the irrational exuberance phase of the technology boom during the 1990s,  
1003 when analysts were accused of fueling the market by exaggerating the prospects of  
1004 dot.com firms. It was this behaviour that ultimately led to Regulation FD (Fair  
1005 Disclosure) in 2000 and the Global Analyst Research Settlements of 2002 in the U.S.  
1006 which removed incentives for sell-side analysts to curry favor with company  
1007 management by issuing inflated earnings forecasts.

1008  
1009 A study conducted after the Global Settlement found that following the settlement, the  
1010 mean forecast bias declined significantly, whereas the median forecast bias essentially  
1011 disappeared.<sup>56</sup> There are also studies which have shown that analyst optimism is at least  
1012 in part related to the difference between forecasting earnings for firms who report losses  
1013 versus firms who report profits. For example, Jeffery Abarbanell and Reuven Lehavy,  
1014 “Biased Forecasts or Biased Earnings? The Role of Reported Earnings in Explaining  
1015 Apparent Bias and Over/Underreaction in Analysts’ Earnings Forecasts”, *Journal of*  
1016 *Accounting and Economics* 36 (2003), pages 105-146, found that while, on an average

---

<sup>55</sup> The OEB’s benchmark utility equity risk premium and cost of equity was based on the composite of estimates provided by expert witnesses, which included a significant number of DCF-based cost of equity estimates.

<sup>56</sup> Armen Hovakimian and Ekkachai Saenyasiri, “Conflicts of Interest and Analyst Behavior: Evidence from Recent Changes in Regulation”, Arizona State University, April 20, 2009.

1017 basis, there appeared to be a forecast bias, the median forecast error was zero. The same  
1018 article cited an earlier study, Michael P. Keane and David E. Runkle, “Are Financial  
1019 Analysts’ Forecasts of Corporate Profits Rational?”, *Journal of Political Economy* 100  
1020 (1998), pages 768-805, which, when the authors eliminated observations from their data  
1021 sample based on the size of negative special items “nearly eliminate evidence of mean  
1022 optimism in their sample.”

1023  
1024 Given the greater transparency of the utility business model (e.g., regulatory filing  
1025 requirements) relative to some other industries, the more stable operations of utilities, and  
1026 the value rather than “glamour” nature of utility shares, analyst optimism should be less  
1027 of an issue with utility earnings forecasts. Moreover, to the extent that any analyst  
1028 optimism is shared by investors and impounded in the stock prices, it would be incorrect  
1029 to reduce the analysts’ growth forecasts without a simultaneous adjustment to dividend  
1030 yields.

1031  
1032 The potential bias of the analysts’ growth rates for U.S. utilities was assessed in three  
1033 separate ways. First, because utilities are quintessentially mature companies, it is  
1034 reasonable to expect that investors would anticipate that, over the long-term, growth  
1035 would parallel the long-term nominal rate of growth in the economy. In this context, the  
1036 Thomson Reuters earnings growth forecasts, for which Foster Associates maintains a data  
1037 base which contains monthly consensus forecasts for utilities back to 1976, were  
1038 compared to the consensus forecasts of long-term growth. Over the past 15 years (since  
1039 1997, the median consensus analysts’ forecast long-term earnings growth rate for the  
1040 sample of U.S. utilities electric utilities was 5.3%. That growth rate is very similar to the  
1041 average consensus forecast of long-term nominal growth in the economy over the same  
1042 period. The average expected long-term nominal rate of growth in the U.S. economy,  
1043 based on consensus forecasts (Blue Chip *Economic Indicators*, March and October  
1044 editions, 1997-2012), was 5.1% from 1997-2012Q2. The similar expected nominal  
1045 growth in the economy compared to the consensus analysts’ forecasts suggests that the  
1046 consensus long-term earnings growth forecasts are not an upwardly biased measure of  
1047 investor expectations.

1048

1049 Second, the consensus analysts' forecasts were compared to the long-term earnings  
1050 forecasts for the same companies made by *Value Line*. As an independent research firm,  
1051 *Value Line* has no incentive to "inflate" its estimates of earnings growth in an attempt to  
1052 make stocks more attractive to investors, which is the criticism frequently aimed at equity  
1053 analysts. Since 1997, the average *Value Line* long-term earnings growth rate forecast for  
1054 the sample of companies was 6.2%, compared to the average consensus analysts' long-  
1055 term earnings growth rate forecast for the same companies of 5.3%. Again, the higher  
1056 *Value Line* than the consensus analysts' forecasts suggest that the consensus long-term  
1057 earnings forecasts are not upwardly biased.<sup>57</sup>

1058

1059 Third, allowed returns for U.S. utilities are derived in large part by reference to the results  
1060 of the DCF model. Regulators in all jurisdictions, however, do not use the same form of  
1061 the DCF model. For example, some regulators may rely on the constant growth model,  
1062 while others prefer to use a multi-stage growth model. In addition, even if different  
1063 jurisdictions use the same form (e.g., constant growth) of the model, the inputs to the  
1064 model are not necessarily derived in equivalent ways. For example, two jurisdictions  
1065 may use the constant growth model but one may favour the use of forecast growth, while  
1066 another may favour the use of historic growth rates. In the aggregate, however, across all  
1067 jurisdictions, the differences in approach likely balance out, resulting in the allowed  
1068 returns reflecting neither an upwardly or downwardly biased measure of the utility cost of  
1069 equity as a result of the underlying growth assumptions. When the allowed returns for all  
1070 U.S. utilities published by Regulatory Research Associates (RRA) are compared to  
1071 monthly constant growth DCF costs of equity for the sample of U.S. electric utilities  
1072 estimated using the consensus long-term earnings forecasts for the past 15 years, the  
1073 comparison shows that the allowed returns for all U.S. utilities as reported by RRA  
1074 exceeded the returns estimated using the constant growth DCF models as follows:

---

<sup>57</sup> In BCUC, 2009 *Cost of Capital Decision*, page 45, the BCUC stated:

The Commission Panel has considered the submission of the JIESC concerning "upward bias" of analysts' estimates and considers that no allegations of upward bias have been levelled against utility analysts and that *Value Line* estimates will be free from any suggestion of upward bias. Accordingly the Commission Panel will not give any weight to suggestions of analyst bias.

1075

**Table 6**

<b>Average Allowed ROEs 1997Q3-2012Q2<sup>1/</sup></b>	10.5%	<b>Average Difference From Allowed ROEs</b>
<b>Constant Growth DCF Cost of Equity 1997Q3-2012Q2</b>	10.2%	-0.3%

1076

<sup>1/</sup> Weighted average.

1077

Sources: Regulatory Research Associates and Rebuttal Schedule 3.

1078

1079

The comparison of the DCF costs of equity to the ROEs allowed by regulators provides a further indication that the earnings forecasts are not an upwardly biased measure of investor expectations.

1082

1083

In addition, I have estimated DCF costs of equity for the sample of U.S. electric utilities using three different models, one based on analysts' earnings growth forecasts, one based on sustainable growth, and a three-stage growth model, which incorporates both analysts' forecasts and long-term growth in the economy. The results of the three models establish a range of DCF costs of equity, bounded at the lower end by the sustainable growth model results and at the upper end by the analysts' earnings forecasts model results, with an average for all three models approximately equal to NSPI's requested ROE of 9.2%.<sup>58</sup> The addition of an adjustment for financing flexibility equal to the 0.50% used by Dr. Booth supports an ROE for NSPI, even without an adjustment for NSPI's low regulated common equity ratio of 37.5% compared to the sample average 48%, of 9.75%.

1093

1094

**E. USE OF U.S. COMPARABLES**

1095

1096

**Q. Dr. Booth takes issue with the use of U.S. utilities in deriving estimates of the cost of equity for Canadian utilities for several reasons, including (1) higher market volatility in the U.S.; (2) higher estimates of the market risk premium in the U.S. than Canada; (3) higher 30-year Treasury than Government of Canada bond yields**

1097

1098

1099

<sup>58</sup> As stated at page 33 of my direct testimony, "The results of the constant growth and three-stage DCF models indicate an estimated "bare bones" cost of equity of approximately 9.25%. A cost of equity of 9.25% is similar to the 9.2% ROE proposed by NSPI."

1100 **and (4) higher risk of U.S. utilities than Canadian utilities. Please address each of**  
 1101 **these factors.**

1102

1103 A. As a general comment, I find Dr. Booth's concerns with the use of U.S. utilities  
 1104 somewhat perplexing, given that (1) Dr. Booth concludes at page 77 that his estimates of  
 1105 the equity market returns in Canada and the U.S. are similar; (2) he states at page 78 that  
 1106 his estimate of the utility equity risk premium using the U.S. S&P gas and electric index  
 1107 is broadly similar to his CAPM risk premium estimate for Canadian utilities; (3) he gives  
 1108 weight to U.S. evidence in deriving his equity market risk premium for Canada (page 66);  
 1109 (4) he shows that the most recent Fernandez market risk premium surveys indicate  
 1110 virtually identical equity risk premiums in the two countries (Appendix B, page 11); and  
 1111 (5) he agrees that one can select a sample of utilities from the U.S. universe that is  
 1112 comparable to the overall population of utilities in Canada (Appendix C, page 7).

1113

1114 With respect to his comment that there has been higher market volatility in the U.S.  
 1115 market than in Canada, the historic annual volatility in the two markets over the longer-  
 1116 term has been quite similar. The table below compares the average arithmetic equity  
 1117 market returns and the corresponding standard deviations, as well as the compound  
 1118 (geometric) average returns from 1926-2011 and post-World War II (1947-2011) for the  
 1119 two countries.

1120

**Table 7**

	<b>Canada</b>		
	<b>Arithmetic Average</b>	<b>Standard Deviation</b>	<b>Compound Average</b>
1926-2011	11.2%	18.9%	9.6%
1947-2011	11.8%	17.1%	10.4%
	<b>United States</b>		
	<b>Arithmetic Average</b>	<b>Standard Deviation</b>	<b>Compound Average</b>
1926-2011	11.8%	20.3%	9.8%
1947-2011	12.3%	17.4%	10.9%

1121

Source: Canadian Institute of Actuaries, *Report on Canadian  
 Economic Statistics 1924-2011*, Ibbotson Associates,  
*Stocks, Bonds, Bills and Inflation: 2012 Yearbook*.

1122

1123

1124

1125 To put the differences in the relative volatility and risk of the two markets in perspective  
1126 over these two time periods, it is useful to compare the differences between the arithmetic  
1127 and compound average returns in the two markets. The difference between the arithmetic  
1128 and compound average returns is approximately equal to one-half of the variance in the  
1129 annual returns. The variance in the arithmetic average returns in turn is equal to the  
1130 standard deviation squared. The larger the difference between the arithmetic and  
1131 compound averages, the more volatility there has been in the annual returns.

1132  
1133 For the longer period, 1926-2011, the difference in the arithmetic and compound average  
1134 returns in Canada was 1.7%; the corresponding difference in the U.S. was 2.0%, a  
1135 difference between the two of approximately 0.3%. During the post-World War II  
1136 period, the difference in both Canada and the U.S. was approximately 1.4%. The two  
1137 differentials between the Canadian and U.S. arithmetic and compound average returns  
1138 can be interpreted as the difference in equity return required for the difference in  
1139 volatility between the two markets. In other words, based on the longer period, the equity  
1140 market return required would be 0.30% higher in the U.S. than in Canada and based on  
1141 the post-World War II period, the equity market return required would be the same in the  
1142 U.S. and in Canada. In sum, the differences are *de minimus*.

1143  
1144 Further, a comparison of the volatility of the two equity markets from approximately the  
1145 time of the Lehman Brothers failure that Dr. Booth references at page 41 (i.e., over the  
1146 past four years from August 2008 to July 2012) shows that, based on the standard  
1147 deviations of weekly price changes in the S&P/TSX Composite (Canada) and the S&P  
1148 500 (United States), the two markets have exhibited virtually identical volatility.

1149  
1150 With respect to the higher estimates of market risk premiums in the United States than  
1151 Canada, that difference may be simply due to the derivation of estimates from historical  
1152 data. Historically, achieved risk premiums in Canada were lower than in the U.S., due  
1153 largely to the fact that interest rates in Canada were historically significantly higher than  
1154 in the U.S. That is no longer the case. As noted above, the most recent Fernandez survey

1155 of equity market risk premiums would no longer appear to support Dr. Booth's  
1156 contention that estimates of market risk premiums are higher in the U.S. than in Canada.

1157  
1158 With respect to higher 30-year Treasury than Government of Canada bond yields, while it  
1159 is true that they are higher, other interest rate comparisons show very similar levels in the  
1160 two countries. As shown in the Table below, the 10-year government bond yield (which  
1161 is the benchmark yield in the U.S.) has been higher in Canada, and the yields on  
1162 corporate bonds of various investment grade categories have been very similar. On  
1163 balance, the comparison across multiple categories of interest rates indicates a similar  
1164 cost of capital environment in the two countries.

1165 **Table 8**

1166 Source: Rebuttal Schedule 4

1167

1168 Finally, with regard to the risk of U.S. versus Canadian utilities, the population of  
1169 Canadian investor-owned utilities is dominated by “pipes” and “wires” companies and  
1170 the population of U.S. investor-owned utilities is dominated by vertically integrated  
1171 electric utilities. It is therefore not surprising that the universe of U.S. utilities is  
1172 somewhat riskier than the universe of Canadian utilities.

1173

1174 **Q. Dr. Booth claims that U.S. vertically integrated utilities are riskier than NSPI. He**  
1175 **purports to demonstrate this conclusion by comparing the betas of a sample of low**  
1176 **risk U.S. utilities that he considers to be of similar risk to his benchmark Canadian**

1177 **utility, a sample of vertically integrated electric utilities and Emera. Do you agree**  
 1178 **with his analysis?**

1179

1180 A. No, in several respects. First, not all utilities in the U.S. would be considered of  
 1181 comparable risk to NSPI, just as not all utilities in the U.S. are of comparable risk to each  
 1182 other. Although it is possible to select a sample of U.S. electric utilities that may be of  
 1183 higher risk than NSPI, it does not logically follow that all U.S. vertically integrated  
 1184 utilities are of higher risk than NSPI or that it is not possible to select a sample of U.S.  
 1185 electric utilities that is of comparable risk to NSPI.

1186

1187 Dr. Booth's selection of U.S. electric utilities appears to have been fairly random, in  
 1188 contrast to my own selection criteria, which are set out on page 27 and 28 of my direct  
 1189 testimony.<sup>59</sup> Rebuttal Schedule 5<sup>60</sup> provides comparative data for Dr. Booth's electric  
 1190 utility sample and mine. Rebuttal Schedule 5 demonstrates that Dr. Booth's sample of  
 1191 electric utilities is a higher risk sample than mine. To illustrate, the median S&P and  
 1192 Moody's debt ratings for my sample are A- and Baa1 respectively. The corresponding  
 1193 ratings for his sample are BBB and Baa2.

1194

1195 **Q. Dr. Booth attempts to demonstrate that his sample of vertically integrated utilities**  
 1196 **are of materially higher risk than the sample of low risk U.S. utilities that he**  
 1197 **considers of comparable risk to a benchmark Canadian utility by comparing the**  
 1198 **betas of the two samples over time. Would you please comment on his findings?**

1199

1200 A. Rebuttal Schedule 2 presents the published *Value Line* betas for his vertically integrated  
 1201 electric utility sample and low risk utility sample as well as my vertically integrated  
 1202 electric utility sample from 1996 to 2012. The table below summarizes the differences in

---

<sup>59</sup> Dr. Booth judges whether the utilities in his sample are relatively "pure" utilities by the percentage of revenues reported by his data source as "electric utility". These percentages can be misleading, as in the case of Hawaiian Electric Industries, for which Dr. Booth's data source reports 92% regulated revenues. Hawaiian Electric Industries is a combined electric utility and banking firm, whose 2011 earnings were comprised of \$100 million electric utility, \$60 million banking and -\$22 million "Other". Hawaiian Electric Industries is categorized by the Edison Electric Institute as a diversified utility, as contrasted with "Regulated" or "Mostly Regulated".

<sup>60</sup> Rebuttal Schedule 5, pages 1 and 2 of 2 is an update of Schedule 6 from my direct testimony and corresponding data for Dr. Booth's sample.

1203 the *Value Line* betas among the three samples. The *Value Line* betas for Dr. Booth's  
 1204 electric utility samples have been somewhat higher than those of his low risk utility  
 1205 sample. For my electric utility sample, however, the average and median *Value Line*  
 1206 betas have actually been slightly lower than those of Dr. Booth's **low risk** utility sample.  
 1207 The comparison highlights the facts that (1) beta is only one measure by which relative  
 1208 risk can be assessed; and (2) in isolation, the reported *Value Line* betas do not indicate  
 1209 significant differences in risk among the various samples.

1210

**Table 9**

	<u>Average Differences</u>	
	<u>1996-2012</u>	<u>2008-2012</u>
	<b>McShane-Booth Electric Utility Sample</b>	
<b>Average</b>	-0.03	-0.02
<b>Median</b>	-0.03	-0.05
	<b>McShane Electric Utility - Booth Low Risk Sample</b>	
<b>Average</b>	-0.03	-0.06
<b>Median</b>	-0.03	-0.09
	<b>Booth Electric Utility - Booth Low Risk Sample</b>	
<b>Average</b>	0.03	0.06
<b>Median</b>	0.03	0.09

1211 **Q. What about Dr. Booth's comments that Emera's beta is even lower than the low**  
 1212 **risk utility sample and the universe of Canadian utilities, from which he infers that**  
 1213 **the "market views Emera differently from the U.S. electric" and "Since NSPI has**  
 1214 **been the major holding of Emera since inception this conclusion also applies to**  
 1215 **NSPI" (page 84)?**

1216

1217 **A.** As Dr. Booth quite correctly points out (page 84), one cannot put much stock in  
 1218 individual company betas. This is particularly true in cases where a company has been  
 1219 transforming its business or, as Emera has been over the past 10+ years, growing and  
 1220 diversifying its operations. Given the company's evolution since 2001 (the year Bangor  
 1221 Hydro was acquired), no reliable inferences as to how the market views Emera can be  
 1222 drawn from its betas.

1223

1224 **Q. At page 87, Dr. Booth says that it is commonly accepted that U.S. utilities are**  
1225 **riskier than U.S. utilities, and cites both Moody's and S&P in support of his**  
1226 **conclusion. Please respond.**

1227

1228 A. With the caveat that its risk assessment is from the perspective of a bond holder, not an  
1229 equity holder, Dr. Booth is correct that Moody's considers the Canadian regulatory  
1230 environment generally to be more supportive than the U.S. regulatory environment  
1231 generally. However, that does not mean that that Moody's views all U.S. regulatory  
1232 jurisdictions as the same, that it views all U.S. utilities to be higher business risk than all  
1233 Canadian utilities, or that Moody's views all Canadian utilities as of lower overall  
1234 (business plus financial) risk than U.S. utilities. Schedule 6 of my direct evidence (and as  
1235 noted above) shows that the average and median Moody's rating for my sample of  
1236 electric utilities is Baa1, which is the same rating that it had assigned to NSPI prior to  
1237 withdrawal. From Moody's perspective, then, my electric utility sample is of comparable  
1238 total risk to NSPI.

1239

1240 **.Q. At page 89, Dr. Booth highlights the Moody's reference to the four utility**  
1241 **bankruptcies that have occurred in the U.S. in the past 50 years due to insufficient**  
1242 **rate relief as evidence of the regulatory higher risk attributed to the U.S. by**  
1243 **Moody's. Was the point of Moody's reference to the bankruptcies to underscore**  
1244 **higher regulatory risk in the U.S.?**

1245

1246 A. No, it was, as I interpreted Moody's comment, to underscore the importance of regulatory  
1247 relief to the financial health of utilities. With regard to the specific four bankruptcies,  
1248 that were related to insufficient rate relief; two of those were nuclear related and the other  
1249 two were California utilities who were unable to obtain sufficient rate relief when power  
1250 costs spiked during the transition to a deregulated market. It is of note, with regard to the  
1251 latter, that Moody's rates the two California utilities' regulatory framework factors as  
1252 "A", the rating on that factor that it has accorded Canadian utilities operating in Alberta,  
1253 British Columbia, Ontario, Newfoundland and Labrador as well as Nova Scotia.

1254 **Q. What about S&P?**

1255

1256 A. Dr. Booth claims at page 89 that the typical bond rating in the U.S. is BBB and the  
 1257 typical bond rating in Canada is A. Neither of these conclusions is correct. As S&P  
 1258 stated in a recent report “Our present ratings on U.S. regulated utility companies remain  
 1259 firmly entrenched at an average 'BBB+'...”<sup>61</sup>, which is the same as NSPI’s S&P rating.<sup>62</sup>  
 1260 By comparison, the average S&P rating for Canadian utilities is A-, one notch lower (see  
 1261 Schedule 1 of my direct evidence). The average and median rating for my electric utility  
 1262 sample is A-, as shown in Schedule 6 of my direct evidence, the same as for the universe  
 1263 of investor-owned Canadian utilities, and higher than NSPI’s S&P rating. From S&P’s  
 1264 perspective, NSPI is of similar total risk to the universe of U.S. utilities, and of somewhat  
 1265 higher risk than both the universe of Canadian utilities and my U.S. electric utility  
 1266 sample.

1267

1268 **Q. As part of his support for the higher risk of U.S. utilities, Dr. Booth refers to S&P’s**  
 1269 **concern with FERC regulation in respect to Enron and ring fencing. Does this**  
 1270 **statement by S&P lead to the conclusion that S&P finds FERC regulated utilities to**  
 1271 **face higher regulatory risk than Canadian utilities?**

1272

1273 A. No. In a report comparing transmission utilities, AltaLink (regulated by the Alberta  
 1274 Utilities Commission), American Transmission Company (ATC) and Independent  
 1275 Transmission Company (ITC), the latter two FERC-regulated, S&P concluded that  
 1276 AltaLink faced higher business risk than ATC. This conclusion was largely due to S&P’s  
 1277 conclusion that ATC faced the lowest regulatory risk of the three transmission  
 1278 companies.<sup>63</sup>

---

<sup>61</sup> S&P, *Industry Economic and Ratings Outlook: U.S. Regulated Utilities Will Likely Stay On A Stable Trajectory For The Rest Of 2012 And Into 2013*, July 17, 2012.

<sup>62</sup> Dr. Booth also states in response to Booth (NSPI)-21, “Note Dr. Booth is aware that many US utilities are rated non-investment grade, but this reflects the different degree of regulatory protection in Canada versus the U.S.” Contrary to Dr. Booth’s assertion, there are not many utilities in the US that are rated non-investment grade. In its August 2012 report entitled *Issuer Ranking: U.S. Regulated Utility Companies, Strongest To Weakest*, of S&P’s 234 regulated utility ratings, there were six that were non-investment grade, three of which were for affiliated companies.

<sup>63</sup> S&P, *Peer Comparison: North American Stand-Alone Transmission Companies Deliver Electricity... and Profits*, April 2006. In addition, Moody’s considers the FERC-regulated electric transmission utilities to have the lowest

1279

1280 **Q. What is the implication of the conclusion that NSPI's debt ratings are similar to or**  
 1281 **lower than those of your U.S. electric utility sample?**

1282

1283 A. The implication is that NSPI is of comparable to somewhat higher total risk than my  
 1284 sample of U.S. electric utilities and its return on equity should be comparable to  
 1285 somewhat higher than the returns available to its peers.

1286

1287 **Q. What have been the returns on equity allowed for U.S. utilities, which, according to**  
 1288 **S&P are, on average, rated BBB+, the same as NSPI?**

1289

1290 A. Over the past 12 months, U.S. utilities (electric and gas) have been allowed returns on  
 1291 equity averaging approximately 10.0%. The ROEs that were adopted for companies in  
 1292 my comparable electric utility sample over the same 12-month period, averaged 10.1%.<sup>64</sup>  
 1293 Both are higher than the 9.2% ROE that NSPI is requesting in this GRA, underscoring  
 1294 the conservative nature of NSPI's request.

1295

### 1296 **III. REBUTTAL TO MS. SMITH**

1297

1298 **Q. Ms. Smith takes issue with several aspects of NSPI's requested return on equity.**  
 1299 **Please address Ms. Smith's concerns.**

1300

1301 A. First, at page 12 of her Direct Testimony, Ms. Smith incorrectly characterizes the  
 1302 Company's requested return on equity as an Earnings Sharing Mechanism. NSPI is not  
 1303 proposing an earnings sharing mechanism. As NSPI confirmed in Exhibit OR-06,  
 1304 "Sharing mechanisms are typical of Performance-Based regulatory frameworks. There is  
 1305 no such framework in effect for NS Power. Thus this information is not applicable."  
 1306 Nova Scotia Power is requesting to have its return on equity set in the same manner, i.e.,  
 1307 expressed within a range, and the same return on equity range of 9.1% to 9.5%, with rates

---

regulatory risk among U.S. utilities. Moody's gives American Transmission Co. an AA rating on regulatory framework.

<sup>64</sup> Regulatory Research Associates Inc. and Rebuttal Schedule 6.

1308 set with the ROE at the same level (9.2%), as was approved by Board for 2012. The  
1309 Board has expressed NSPI's allowed return on equity within a range since NSPI's first  
1310 rate application subsequent to privatization. In each test year since 1993, NSPI's rates  
1311 have been set at the mid-point of the allowable ROE range, with the exception of the  
1312 2012 test year. For the 2012 test year, rates were set using an ROE slightly below the  
1313 mid-point of the range (9.2% rather than 9.3%), as agreed to as part of the negotiated  
1314 settlement.

1315  
1316 For the 2013 and 2014 test years, as part of the proposed Rate Stabilization Plan, NSPI is  
1317 explicitly proposing to ensure that 100% of any earnings above the upper end of the  
1318 allowable ROE range are to the benefit of ratepayers. To the extent that NSPI earns an  
1319 ROE in excess of 9.5%, 100% of the earnings will be used to reduce costs that were  
1320 forecast to be incurred in the test years, but deferred for future recovery. However, if  
1321 NSPI earns an ROE less than 9.2%, 100% of the short-fall in earnings from the target  
1322 ROE will be to the account of the shareholder. Contrary to Ms. Smith's assertion, there  
1323 is no provision in the Company's proposed Rate Stabilization Plan that would permit  
1324 NSPI to raise rates if its actual regulated ROE falls below 9.1%. In other words, during  
1325 the test period, there is a cap on the actual regulated ROE with no corresponding floor.  
1326 While Ms. Smith is correct that the ROE proposed for rate setting purposes is below the  
1327 mid-point of the ROE range, the asymmetry in the range of potential actual ROEs favours  
1328 customers, not the shareholder.

1329  
1330 Second, Ms. Smith claims that what she refers to as the earnings sharing mechanism  
1331 would allow NSPI to earn an ROE that is considerably higher than the target ROE, i.e.,  
1332 up to 300 basis points above the target ROE before any cost reductions would be flowed  
1333 through to customers. This is not correct. If the upper end of the ROE range were 300  
1334 basis points above the 9.2% target ROE, NSPI would be allowed to earn an allowed ROE  
1335 of 12.2% before any reduction of the Fixed Cost Recovery Deferral. The Company is  
1336 proposing to flow through to customers 100% of earnings when the ROE exceeds 9.5%,  
1337 30 basis points (0.30%) above the 9.2% ROE at which 2013 and 2014 rates would be set.  
1338 NSPI's ability to earn returns in excess of the ROE at which rates are set will be

1339 considerably less than is typical of other utilities, both those that are operating with and  
 1340 without performance-based rate plans. Most Canadian utilities not operating with  
 1341 performance-based rate plans are allowed to retain 100% of earnings above the allowed  
 1342 ROE. For those operating with performance-based rate plans that include an earnings  
 1343 sharing mechanism are permitted to earn ROEs that exceed the specified allowed ROE by  
 1344 materially more than 0.30%.<sup>65</sup>

1345  
 1346 **Q. Ms. Smith states, at page 13, “While I am not a cost of capital expert, I believe that**  
 1347 **the reduction in risk alone from the Rate Stabilization Plan should result in some**  
 1348 **reduction to the ROE.” Do you agree with Ms. Smith?**

1349  
 1350 A. No. First, Ms. Smith seems to ignore entirely the context of NSPI’s proposal. This is not  
 1351 a typical two-year test period. NSPI is proposing to limit rate increases and defer  
 1352 recovery of forecast costs well beyond the two-year test period during which those costs  
 1353 are expected to be incurred. Allowing approved costs to be deferred is not a guarantee  
 1354 that those costs will be recovered, contrary to Ms. Smith’s claim at page 12. The longer  
 1355 the recovery of incurred costs is deferred, the greater the uncertainty that those costs will  
 1356 be recoverable. All other things equal, the deferral of cost recovery increases, not  
 1357 decreases, NSPI’s risk. Second, Ms. Smith appears to believe that by proposing a two-  
 1358 year, rather than a one-year, test period reduces NSPI’s risk (page 10, lines 170-171).  
 1359 This contention is erroneous. Extending a test period from one to two years does not  
 1360 decrease risk, as the Company’s forecasting risk is higher than it would be if it were only  
 1361 forecasting costs and load for a single test year. Ms. Smith appears to acknowledge that  
 1362 to be true, as she states at page 13, “It is usually more difficult to develop accurate  
 1363 forecasts of loads and of fuel costs the further into the future the forecast is being made.”

1364  
 1365 Both one and two-year test periods are fairly common in Canada.<sup>66</sup> While Ms. Smith  
 1366 expects that the approval of revenue amounts for two years will be viewed very

---

<sup>65</sup> For example, under its incentive regulation plan, Union Gas, with whom Dr. Booth has compared NSPI, is allowed to earn an ROE of up to 200 basis points above the benchmark return on equity before any sharing with customers.

<sup>66</sup> For example, two-year test periods are typical in Alberta and have been frequently used in British Columbia.

1367 favourably by the financial markets, in my more than 30 years of experience as a cost of  
1368 capital expert, I have found that neither financial markets nor financial market  
1369 participants have attributed lower risk to utilities with two-year rather than one-year test  
1370 periods.

1371

1372 **Q. Ms. Smith comments at page 12 that amounts approved as part of the 2013 and**  
1373 **2014 revenue requirements that are deferred will not be subject to any further**  
1374 **review of prudence. Would you view that as unusual?**

1375

1376 A. No. This GRA is the forum for testing the prudence of the costs forecast to be incurred  
1377 during the 2013 and 2014 test period. Once the UARB has approved the 2013 and 2014  
1378 revenue requirements, whether NSPI sets rates to recover 100% of the forecast costs  
1379 during 2013 and 2014 or defers a portion of those approved costs for future recovery, any  
1380 after-the-fact prudence review of the approved costs would constitute retroactive  
1381 ratemaking, a practice well understood to be precluded by law.

1382

1383 **Q. Ms. Smith recommends at page 13 that the deferred amounts be financed with**  
1384 **short-term debt, rather than at NSPI's weighted average cost of capital. Is this a**  
1385 **reasonable proposal?**

1386

1387 A. No. The deferred amounts will not be short-term assets; they are to be recovered over an  
1388 extended period of time. Ms. Smith recognizes that, stating at pages 9 to 10 that the  
1389 deferred amounts are to be recovered over an eight-year period, commencing in 2015.  
1390 There is no basis for attributing a short-term cost of financing to these long-term deferred  
1391 amounts. Further, as discussed earlier, NSPI's regulated common equity ratio is already  
1392 low for a utility of its business risk. If the deferred costs were required to be financed  
1393 with short-term debt only, NSPI's regulated common equity ratio would be lower and its  
1394 credit metrics would be weaker. Higher leverage and weaker credit metrics would put  
1395 pressure on the existing debt ratings and potentially raise, not lower, the costs of both  
1396 debt and equity, and thus the overall cost of capital.

1397

1398 **Q. At page 6, Ms. Smith speculates that a lower ROE would be justified because of**  
1399 **lower interest rates. Please comment.**

1400

1401 A. While Ms. Smith is correct that prevailing government and investment grade bond yields  
1402 are lower currently than at the time NSPI negotiated its current and requested allowed  
1403 ROE, the reductions in interest rates that have transpired are, as indicated in my response  
1404 to Dr. Booth above, largely due to a confluence of factors that have little, if any,  
1405 correlation with trends in the market cost of equity. NSPI's requested 9.2% is, as  
1406 demonstrated in both my direct testimony and response to Dr. Booth, a conservative ROE  
1407 in light of the Company's risk profile and returns available to its peers.

1408

1409 **Q. Does this conclude your rebuttal evidence?**

1410

1411 A. Yes.

## REPLY EVIDENCE OF JAMES M. COYNE

***I. INTRODUCTION***

1 Q1. **PLEASE STATE YOUR NAME, AFFILIATION, AND BUSINESS ADDRESS.**

2 A1. My name is James M. Coyne, and I am employed by Concentric Energy Advisors, Inc.  
3 (“Concentric”) as a Senior Vice President. My business address is 293 Boston Post Road  
4 West, Suite 500, Marlborough, MA 01752.

5  
6 Q2. **ARE YOU THE SAME JAMES M. COYNE WHO SUBMITTED DIRECT  
7 TESTIMONY EARLIER IN THIS PROCEEDING?**

8 A2. Yes, I am.

9  
10 Q3. **ON WHOSE BEHALF ARE YOU TESTIFYING?**

11 A3. I am submitting this Testimony on behalf of Nova Scotia Power, Inc. (“NSPI”, or the  
12 “Company”) in this proceeding.

13  
14 Q4. **WHAT IS THE PURPOSE OF YOUR REPLY TESTIMONY?**

15 A4. The purpose of my Reply Testimony is to respond to portions of the evidence submitted  
16 by Dr. Laurence D. Booth and Ms. Lee Smith relating to business and economic risk. My  
17 Reply Testimony supplements my Direct Testimony, and that of Kathleen C. McShane  
18 with regard to the appropriateness of Ms. McShane’s proxy group selection and her  
19 description of risk factors specific to NSPI. These issues have a direct bearing on the  
20 allowed cost of equity (“ROE”) for NSPI in this proceeding.

21 Dr. Booth acknowledges NSPI’s requested ROE and capital structure to be reasonable: “I  
22 would therefore regard NSPI’s request to be allowed a 9.2% on 37.5% common equity to  
23 be within, but near the top end of reasonable financial metrics.”<sup>1</sup> But, there are several  
24 elements of Dr. Booth’s testimony that ultimately lead to his unduly low recommended  
25 ROE of 7.5 - 8.5 percent<sup>2</sup> in contrast to the above conclusion. I address each of these  
26 issues in turn, principally relating to the Company’s business risk:

- 27
- The facts related to NSPI’s business and economic risks; and
  - The relative risks of the Canadian and U.S. investment environment.
- 28

---

<sup>1</sup> Evidence of Laurence D. Booth, at 4, lines 12-14.

<sup>2</sup> For the years 2013 and 2014, respectively. Booth, at 2, line 30.

**REPLY EVIDENCE OF JAMES M. COYNE**

1 I ultimately conclude that Ms. McShane appropriately characterizes NSPI's business and  
2 economic risk in her statement of evidence, and has appropriately relied on a proxy group  
3 consisting of U.S. electric utilities to estimate NSPI's cost of equity.

4 My analyses and recommendations are supported by the data presented in Exhibits JMC-  
5 1 and JMC-2, which have been prepared by me or under my direct supervision.

6  
7 **Q5. WHAT ARE YOUR CONCLUSIONS REGARDING THE EFFECT OF**  
8 **BUSINESS RISK ON NSPI'S COST OF EQUITY?**

9 A5. Based on my review of the facts in this proceeding, along with my experience evaluating  
10 business risk in other jurisdictions, it is my opinion that NSPI faces significant business  
11 risks, particularly in the areas of potential load loss, fuel pricing, capital expenditures,  
12 environmental compliance, and the recovery of costs related to those items. I find that  
13 NSPI's business risks are higher than those of the various Canadian companies referred  
14 to by Dr. Booth, that Dr. Booth has misconstrued the facts related to NSPI's business and  
15 economic risks, and that many of his statements are unsupported. I also find that NSPI  
16 faces comparable business and economic risks to that of integrated electric utilities in the  
17 U.S. Following a review of the business risks of comparable Canadian and U.S. utilities,  
18 I find that Ms. McShane has appropriately relied on a proxy group consisting of U.S.  
19 utilities in her analysis of the appropriate return on equity for NSPI.

20  
21 **Q6. HOW IS THE REMAINDER OF YOUR REPLY TESTIMONY ORGANIZED?**

22 A6. The remainder of my Reply Testimony is organized as follows. In Section II, I define  
23 business risk and discuss its effect on a utility's return on equity. Section III describes  
24 the primary business risks of NSPI, and addresses issues presented by Dr. Booth and Ms.  
25 Smith on this topic. In Section IV, I comment on the appropriateness of using a proxy  
26 group of U.S. utilities in order to calculate return on equity. Finally, Section V provides  
27 my conclusions.

28

## REPLY EVIDENCE OF JAMES M. COYNE

**II. THE EFFECTS OF BUSINESS RISK ON A UTILITY'S RETURN ON EQUITY**

1 Q7. AS A PRELIMINARY MATTER, DOES YOUR TESTIMONY ADDRESS DR.  
2 BOOTH'S TESTIMONY ON CAPITAL STRUCTURE?

3 A7. No. The allowed common equity ratio for the Company does not appear to be a matter of  
4 contention. Dr. Booth concludes "I regard NSPI's current common equity ratio of 37.5%  
5 for rate setting purposes to be reasonable."<sup>3</sup> I would note, however, that Dr. Booth's  
6 rationale for accepting the Company's common equity ratio as "reasonable" is based on  
7 Union Gas' current equity ratio of 36%, but Union has a pending application before the  
8 Ontario Energy Board ("OEB") for a 40% equity ratio, and Gaz Metro's 38.5% common  
9 equity ratio cited by Dr. Booth is supplemented by a deemed 7.5% preferred share  
10 component of the capital structure, for a combined 46%. By virtue of Dr. Booth's logic,  
11 and comparison to industry peers, NSPI's common equity ratio is on the low end of the  
12 spectrum.

13 Given that the Company is not requesting any change to its common equity ratio, it is not  
14 evident why Dr. Booth dedicates so much of his testimony to business risk as it relates to  
15 capital structure, (beginning on page 5 and running through page 24), other than perhaps  
16 for his stated personal preference to adjust for business risk in the capital structure.<sup>4</sup> Dr.  
17 Booth even ascribes motives for NSPI's management to favor the interests of  
18 shareholders over customers by "asking for too much equity", but NSPI is not asking for  
19 more equity in this proceeding.<sup>5</sup>

20  
21 Q8. PLEASE DESCRIBE THE GUIDING PRINCIPLES TO BE CONSIDERED  
22 WHEN EVALUATING THE BUSINESS RISKS FACED BY A REGULATED  
23 UTILITY.

24 A8. In both Canada and the U.S., one of the key principles for establishing a fair return on  
25 equity for a regulated utility is that a reasonable return should be "comparable with the

---

<sup>3</sup> *Ibid.*, at 2, lines 5-6.

<sup>4</sup> *Ibid.*, at 11, lines 20-21.

<sup>5</sup> *Ibid.*, at 14, lines 19-23.

**REPLY EVIDENCE OF JAMES M. COYNE**

1 return available from the application of capital to other enterprises of like risk.”<sup>6</sup> This  
 2 principle implies that any evaluation of the reasonableness of a particular return should  
 3 consider investment risk, or the level of risk faced by investors in the enterprise, and how  
 4 the balance of risk and return compares with other companies. Investment risk is  
 5 composed of business risk and financial risk. Business risk includes such things as  
 6 supply risk, demand risk, competitive risk, operating risk, and regulatory risk. Also,  
 7 many business risks are driven by the macro-economy. For example, a weakening local  
 8 or national economy translates to lower electric demand. Financial risk considers the  
 9 amount of financial leverage that is applied to operations, but is apparently not at issue in  
 10 this proceeding.

**Q9. HOW DO BUSINESS RISKS AFFECT A COMPANY’S RETURN ON EQUITY?**

11  
 12 **A9.** Business risks are relevant because of their potential to lead to variation in earnings and  
 13 cash flow, and the level of variation in a company’s earnings and cash flow is directly  
 14 proportional to its return on equity. This relationship between risk and return can be  
 15 observed in the Capital Asset Pricing Model (“CAPM”), which uses the beta coefficient  
 16 to reflect the market (non-diversifiable) business, economic and financial risks of a proxy  
 17 group of companies with similar risk profiles. By incorporating betas from a group of  
 18 similar risk companies, the CAPM provides an estimated ROE for companies with  
 19 similar market risk to the subject company. Company specific risks must then be  
 20 considered in order to determine whether the subject company’s ROE should be adjusted  
 21 relative to that estimate.  
 22

23 Similarly, under the Discounted Cash Flow (“DCF”) model, the required cost of equity is  
 24 estimated based on the sum of the dividend yield and the forecasted earnings growth rate  
 25 for a set of proxy group companies. Business risks for each company are reflected in  
 26 dividend yields and growth rates, and through the initial selection of proxy companies.

27 Since the DCF analysis incorporates an average of the dividend yields and the growth

---

<sup>6</sup> National Energy Board, Reasons for Decision, RH-1-70, p. 7-5. See also National Energy Board, Reasons for Decision, RH-2-2004, p. 17, where the NEB stated that a fair or reasonable return on capital should meet three requirements. It should: (1) be comparable to the return available from the application of invested capital to other enterprises of like risk (the comparable investment standard), (2) enable the financial integrity of the regulated enterprise to be maintained (the financial integrity standard); and (3) permit incremental capital to be attracted to the enterprise on reasonable terms and conditions (the capital attraction standard).

**REPLY EVIDENCE OF JAMES M. COYNE**

1 rates for the proxy group, the DCF result reflects the risk of that group as a whole. As in  
2 the CAPM analysis, company-specific risks must then be considered to determine  
3 whether the subject company ROE should be adjusted to reflect those risks.  
4

5 **Q10. WHAT ARE THE PRIMARY SOURCES OF BUSINESS RISK THAT MAY**  
6 **AFFECT A COMPANY'S COST OF CAPITAL?**

7 A10. The business risks that may affect a company's cost of capital range from narrow local  
8 risks that affect only the subject company to broad market risks of the international and  
9 sovereign economies in which the subject company resides and which are reflected across  
10 the entire proxy group. Narrow company-specific risks include such risks as regional or  
11 provincial-level economic growth risk, provincial or state-level regulatory risk, or risks  
12 involved in local fuel procurement and cost recovery. Broad market risks may include  
13 risks such as GDP growth risk, inflation risk, or federal-level regulatory risks. Given that  
14 the purpose of the proxy group is to provide an estimate of the subject company's market  
15 risk by proxy, it is important that the subject company and the proxy group are affected  
16 similarly by this set of broad market risks. Later in my testimony I will discuss the  
17 relevance of the proxy group companies to which Dr. Booth refers in his evidence, and  
18 the appropriateness of the U.S. proxy group referred to by Ms. McShane.  
19

20 **Q11. WHAT ARE THE PRIMARY SOURCES OF BUSINESS AND ECONOMIC RISK**  
21 **THAT MAY AFFECT AN ELECTRIC UTILITY'S COST OF CAPITAL IN**  
22 **PARTICULAR?**

23 A11. As in other industries, the business risks that affect an integrated electric utility's cost of  
24 capital may materialize in any of the company's revenue, expenses or cash flow line  
25 items that are subject to variability. Integrated electric utilities are subject to variability  
26 in their revenues due to factors such as unexpected changes in load or changes in  
27 customer rates. Integrated electric utilities are subject to variability in expenses due to  
28 factors such as unexpected fuel price variations, or unexpected variations in other  
29 operating costs, including non-cash costs such as accruals to satisfy pension obligations.  
30 Utilities are subject to variability in their cash flow due to factors such as timing

**REPLY EVIDENCE OF JAMES M. COYNE**

1 differences between when capital expenditures are made and when the return of, and  
2 return on, that capital is recovered through rates.

3 These are some examples of business risk for utilities. Unlike non-regulated companies  
4 that must absorb the impact of these events in real time, the utility regulator has the  
5 ability to defer their effect through cost deferral accounts, thereby smoothing the effects  
6 on customer bills over some future time period.

7  
***III. ANALYSIS OF NSPI BUSINESS RISKS***

8 **Q12. ON PAGES 26-27 DR. BOOTH CHARACTERIZES NSPI'S BUSINESS RISKS,**  
9 **DO YOU AGREE WITH HIS ASSESSMENT?**

10 A12. No, I do not.

11  
12 **Q13. PLEASE EXPLAIN YOUR AREAS OF DISAGREEMENT.**

13 A13. On page 27 of his direct evidence, Dr. Booth states that “most companies have to deal  
14 with labour costs, getting their customers to pay their bills, the vagaries of weather  
15 impacting demand and the impact of interest rate volatility on short-term financing  
16 costs.” This statement is made in the context of refuting NSPI’s itemized description of  
17 its risks as provided by the Company in its 2011 Annual Information Form.<sup>7</sup> From this  
18 itemization, Dr. Booth dismisses regulatory risk as being solely a protective factor as a  
19 result of deferrals, and lumps commodity price and foreign exchange risk into the same  
20 category. I disagree with Dr. Booth’s dismissal of regulatory and commodity price risk.  
21 Dr. Booth’s broad-sweeping and unsupported statement is made in attempt to dismiss a  
22 significant portion of NSPI’s remaining list of risks, and to imply that these risks are no  
23 different from risks borne by other utilities. While I agree that most companies do indeed  
24 have to deal with the issues noted in Dr. Booth’s statement, the extent to which any given  
25 company is affected by any one of those issues can and does vary significantly.

26 For example, given its coastal Atlantic location, NSPI has experienced significant  
27 weather events in recent years, which have increased its outages and associated costs. By  
28 way of comparison, from the 2006-2010 period (the most recent comparable data for U.S.  
29 utilities) NSPI has had average System Average Interruption Duration Index (SAIDI) and

---

<sup>7</sup> See NSPI 2013 Annual Information Form, at 17-23.

## REPLY EVIDENCE OF JAMES M. COYNE

1 System Average Interruption Frequency Index (SAIFI) of 10.77 and 3.65, respectively,<sup>8</sup>  
 2 while, from 2000 to 2009, U.S. integrated electric utilities reported SAIDI of  
 3 approximately 2.3 to 11.0, and SAIFI of approximately 1.4 to 1.9.<sup>9</sup> In both cases, NSPI  
 4 is at or beyond the range for U.S. utilities. System outages create both load loss and  
 5 increase O&M expenditures, and these are not equally distributed among utilities.  
 6

7 **Q14. ON PAGE 10 OF HIS DIRECT EVIDENCE, DR. BOOTH STATES THAT, WITH**  
 8 **DEFERRAL ACCOUNTS, “RATEPAYERS’ ALWAYS PAY THE FULL COST**  
 9 **OF SERVICE AND STOCKHOLDER RISK IS LOWERED. DO YOU AGREE?**

10 A14. Not at all. A deferral account will typically spread the cost of a particular cost or  
 11 investment over time, and may deprive the utility of cash flow between the time of  
 12 spending those funds today and the time that those funds are recovered at some future  
 13 date. Further, there is no guarantee that this future obligation will be fulfilled, as the  
 14 utility is always subject to regulatory review of funds to be received through the deferral  
 15 account. In NSPI’s case, the fuel adjustment mechanism (“FAM”) audit and  
 16 recommendation of imprudent actions by Liberty Consulting Group (“Liberty”) is a case  
 17 in point.  
 18

19 **Q15. DO YOU KNOW OF ANY EXAMPLES OUTSIDE OF NOVA SCOTIA WHERE**  
 20 **A UTILITY WAS NOT ALLOWED TO RECOVER ITS DEFERRAL ACCOUNT?**

21 A15. Yes, I do. Enbridge Gas New Brunswick (“EGNB”), a small natural gas local  
 22 distribution company located in New Brunswick and a subsidiary of Enbridge, Inc., will  
 23 likely forgo a deferral account exceeding \$180 million. This past winter the Government  
 24 of New Brunswick legislated changes to amend its Gas Distribution Act (“GDA”) that  
 25 was originally passed in 1999. As part of the amendments to the GDA, the New  
 26 Brunswick Energy and Utilities Board will not:

- Recognize or consider the deferral account as part of the regulated assets of  
 28 EGNB;

<sup>8</sup> Direct Testimony of Lee Smith, at 8, lines 129-140, based on data provided by NSPI.

<sup>9</sup> Including major events; SAIDI expressed in hours for comparability. Source: “An Examination of Temporal Trends in Electric Reliability Based on Reports from U.S. Electric Utilities, Berkeley National Laboratory, January 2012, Figures 4-5.

## REPLY EVIDENCE OF JAMES M. COYNE

- 1           • Permit EGNB to depreciate, amortize or earn a return on the deferral account; or  
 2           • Permit EGNB to establish additional similar revenue shortfall deferral accounts in  
 3           the future.

4           The change is intended to be temporary, with recovery of the deferral account reinstated  
 5           once the distribution system is self-sustainable. Unfortunately for EGNB, there is no set  
 6           time line for a reinstatement, and it is not clear if it will be able to recover the loss. This  
 7           present-day example, taken from the same region as NSPI, illustrates the ongoing  
 8           regulatory risk inherent in deferral accounts, despite the other risk mitigating benefits that  
 9           they provide.

10  
 11   **Q16. ON PAGE 16 OF HIS DIRECT EVIDENCE, DR. BOOTH STATES THAT**  
 12   **“UTILITIES HAVE THE LOWEST BUSINESS RISK OF JUST ABOUT ANY**  
 13   **SECTOR IN THE CANADIAN ECONOMY.” DO YOU AGREE?**

14   **A16.** Not necessarily. While I agree that the business risk for regulated utilities is generally  
 15   lower than that of other sectors, Dr. Booth provides no support for his claim that “utilities  
 16   have the lowest business risk of just about any sector in the Canadian economy.”  
 17   Generally speaking, regulated utilities do have relatively low risk given their exclusive  
 18   service area and the fact that they are provided a competitive return of and on capital  
 19   employed as long as that capital is invested prudently. However, given the greater  
 20   business risks of providing for reliable generation, integrated electric utilities generally  
 21   have higher business risks than pure distribution utilities. Further, NSPI in particular has  
 22   higher business risk than many integrated electric utilities as I will describe later in my  
 23   testimony and as confirmed by the Company’s Standard & Poor’s business risk rating of  
 24   “Strong” as opposed to the “Excellent” business risk rating provided to most integrated  
 25   electric utilities.<sup>10</sup> Therefore, the implication that NSPI’s business risk is among the  
 26   lowest of just about any industrial sector in Canada is unsupported and misleading.

27  
<sup>10</sup> “Nova Scotia Power Inc. outlook revised to negative on growth plan stresses; BBB+ Ratings Affirmed,”  
 Standard and Poor’s, at 1.

## REPLY EVIDENCE OF JAMES M. COYNE

1 Q17. **ON PAGE 16 OF HIS DIRECT TESTIMONY, DR. BOOTH STATES THAT**  
2 **“MOST OF THE RISKS OF NSPI STEM FROM ITS GENERATION**  
3 **FACILITIES.” DO YOU AGREE?**

4 A17. While a significant portion of NSPI’s business risks do stem from its generation facilities,  
5 Dr. Booth’s statement is unsupported, and it is misleading to conclude that the generation  
6 facilities are the primary source of NSPI’s business risks. NSPI’s primary business risks  
7 are derived not only from its generation facilities, but also from its exposure to  
8 continuing load losses, its significant capital expenditures program in support of  
9 transmission upgrades and the LED streetlight changeover, and from the risks  
10 surrounding the recovery of historical and future costs related not only to these items, but  
11 also to fuel, demand side management and vegetation management costs.<sup>11</sup>

12

13 Q18. **WHAT ARE THE RISKS THAT NSPI FACES AND THAT DR. BOOTH**  
14 **DISPUTES?**

15 A18. The primary risks that Dr. Booth disputes are also the primary risks that NSPI faces.  
16 These are:

- 17 • The risk of continuing load loss, primarily as the result of a weak economy, and  
18 as exemplified by the NewPage and Bowater plant closures;
- 19 • The risks posed by an increasing capital expenditures program required to comply  
20 with federal and/or provincial environmental regulations and other purposes; and
- 21 • The residual risk presented by the implementation of deferral accounts which,  
22 while mitigating some of the financial impact from load loss and other financial  
23 losses to the NSPI in the near term will continue to subject the Company to  
24 delayed recovery or non-recovery of those losses.

25

26 Q19. **HOW HAS THE NOVA SCOTIA ECONOMY AFFECTED THE COMPANY’S**  
27 **LOAD?**

28 A19. As I described in my Direct Evidence, and as further detailed in Exhibit JMC-1, the Nova  
29 Scotia economy continues to struggle economically. The Nova Scotia pulp and paper  
30 sector has been especially hard-hit, with sales volume falling nearly 18 percent in the first

---

<sup>11</sup> 2013 GRA, at 128-131.

## REPLY EVIDENCE OF JAMES M. COYNE

1 quarter of 2012 from the same period in 2011. Meanwhile, continuing high  
 2 unemployment and a general slowdown in commercial and industrial activity have  
 3 combined to reduce the Company's load. Further, continuing loss of load in other sectors  
 4 is expected to reduce demand by 3.2 percent from the 2012 General Rate Application  
 5 ("GRA") load forecast<sup>12</sup>, and there is no specific regulatory deferral or other form of  
 6 compensation for stranded fixed costs that were associated with supporting this load.

7 Dr. Booth indicates that "demand is typically insensitive to rate increases,"<sup>13</sup> but he  
 8 provides no supporting evidence to this opinion. When asked in an interrogatory, Dr.  
 9 Booth responds, "Insensitive means inelastic. If demand were elastic there would be no  
 10 justification for regulation as by definition the market is competitive."<sup>14</sup> However, the  
 11 price sensitivity of load to increasing electricity prices is evidenced by the significant  
 12 involvement of commercial and industrial customer advocates in this case. Also, for the  
 13 purpose of its load forecast, NSPI estimates a price elasticity of approximately -0.1 for  
 14 residential customers, indicating some price sensitivity. In general, econometric evidence  
 15 shows that electric price elasticities are typically in the -0.1 through -0.9 range for all  
 16 customer classes, suggesting electric consumers do indeed respond to price signals.<sup>15</sup>

17  
 18 **Q20. WHAT ARE THE EFFECTS ON NSPI'S RISK PROFILE IN LIGHT OF THE**  
 19 **NEWPAGE PORT HAWKESBURY AND BOWATER PLANT CLOSURES AND**  
 20 **SUBSEQUENT REVENUE DEFERRALS?**

21 **A20.** Recent plant closures in Nova Scotia's pulp and paper sectors are manifestations of the  
 22 continuing risk that NSPI will not fully recover its fixed costs associated with supporting  
 23 this load. Dr. Booth concedes that "if both [plants] operate and the load retention rates  
 24 are approved then at best the rates will recover incremental electricity costs plus a much  
 25 reduced contribution to NSPI's fixed costs."<sup>16</sup> Indeed, the Company's 2013 General Rate

<sup>12</sup> NS Power 2013 GRA, at 34-35

<sup>13</sup> Booth, at 16, line 31.

<sup>14</sup> NSPI Information Requests to Nova Scotia Utility and Review Board, Dr. Laurence Booth, Response to IR-20.

<sup>15</sup> See, for example "Regional Difference in Price-Elasticity of Demand for Energy," RAND Corporation, 2005. It is important to note that while elasticity metrics with absolute values between 0.0 and 1.0 are typically described as "inelastic," this is a relative term. Given that the statistic describes the expected percentage change in demand for any given percentage change in price, it follows that for statistics of -0.1 to -1.0, one would expect a reduction in demand for any given increase in price, although that percentage reduction in demand would not be expected to be as great as the given percentage increase in price.

<sup>16</sup> Booth at 28, lines 15-17.

## REPLY EVIDENCE OF JAMES M. COYNE

1 Application assumes that the NewPage mill will not contribute to system fixed costs in  
 2 2013 and 2014, and that any contribution to fixed costs will benefit customers – but not  
 3 equity holders – by reducing the fixed cost deferral.<sup>17</sup> The Bowater plant is now  
 4 permanently closed, so it will make no further contribution to fixed costs.

5 A reduced customer contribution to NSPI’s fixed costs has financial implications at two  
 6 levels. First, these reduced contributions mean that NSPI’s remaining customers will  
 7 have to bear the remaining fixed costs associated with those plants, which are expected to  
 8 reach \$44 million by the end of 2012.<sup>18</sup> Second, the deferral account as proposed would  
 9 recover these fixed costs over an eight-year period, meaning that NSPI will only recover  
 10 its fixed costs over the eight years following the approval of those costs through the  
 11 General Rate Application. This delay in receiving whatever fixed costs are recovered  
 12 through the deferral account harms the Company’s liquidity and puts it at risk for cash  
 13 shortfalls.

14  
 15 **Q21. DR. BOOTH STATES ON PAGE 29 OF HIS EVIDENCE THAT “BY PLACING**  
 16 **THE PORT HAWKESBURY COSTS IN A DEFERRAL ACCOUNT FOR**  
 17 **FUTURE DISPOSITION [THIS] EFFECTIVELY REMOVES THE STRANDED**  
 18 **ASSET RISK FACED BY NSPI’S SHAREHOLDER.” DO YOU AGREE?**

19 **A21.** No I do not, for three primary reasons. First, as described above, by stretching the fixed  
 20 cost payments over time, deferral accounts adversely impact liquidity, given that the  
 21 Company’s cash receipts are being deferred from the time incurred to some later date.  
 22 Reinforcing this point, Pacific Northern Gas, which Dr. Booth cited on pages 28-29 of his  
 23 evidence as having been helped by its regulator to avert “a huge company threatening  
 24 event”, states in its 2005 annual report:

25 The recovery of the Company’s accumulated deferral accounts has an  
 26 impact on liquidity requirements. Recovery of the deferral accounts  
 27 through rates charged to customers is dependent upon regulatory approval  
 28 and the ability to set rates high enough to recover such balances while  
 29 maintaining the competitiveness of retail gas prices, and is therefore at  
 30 risk.<sup>19</sup>

---

<sup>17</sup> 2013 GRA, at 35.

<sup>18</sup> *Ibid.*, at 129.

<sup>19</sup> Pacific Northern Gas, Annual Report, 2005, at 12.

## REPLY EVIDENCE OF JAMES M. COYNE

1 Second, and as the Pacific Northern Gas citation above demonstrates, since the deferral  
2 account recovers a pre-determined set of stranded fixed costs from a smaller customer  
3 base, customer rates will need to increase. As noted in the 2013 General Rate  
4 Application, while fuel and other variable costs will fall as a result of the loss of load,  
5 “the fixed costs of the plants and equipment used to generate and distribute electricity  
6 will not decrease enough to compensate for the lost revenue caused by the drop in load –  
7 and those fixed costs will be spread among fewer customers.”<sup>20</sup> Higher electricity rates  
8 would then put additional pressure on NSPI’s already-stressed customer base, and may  
9 lead to additional plant closings or defections, especially at the commercial and industrial  
10 customer level. Equity analysts have specifically identified this risk:

11 In our view, one of the critical issues facing [NSPI] is the potential bias  
12 upwards in electricity rates. In general, the woes of the forest products  
13 sector look to likely drive power rates higher in Nova Scotia.<sup>21</sup>  
14

15 Dr. Booth seems to recognize the potential for such a “death spiral” presenting  
16 TransCanada Mainline as a prime example of rising customer rates. At Page 34 of his  
17 evidence, Dr. Booth cites the National Energy Board (“NEB”) in RH-4-2001 as follows:

18 Specifically, the Mainline’s ability to recover its full cost of service would  
19 be put in jeopardy if its throughput declines to a point where the resulting  
20 tolls exceeded what the market could bear.  
21

22 While the NEB made this observation in 2001, TransCanada continues to be plagued by  
23 the potential for a cycle of falling throughput volumes and increasing rates for remaining  
24 customers. In July 2012, TransCanada announced it was reducing its original 2012  
25 forecast for the Mainline of 2.4 billion cubic feet per day (“BCFD”) by 1.0 BCFD, and  
26 explained that this reduced forecast is “enough to boost expected tolls on the Mainline by  
27 30 percent, given that tolls rise when volumes fall.”<sup>22</sup> In its current mainline tolls  
28 proceeding before the NEB, industrial and consumer advocates have recommended write-  
29 offs to the existing TransCanada ratebase of \$400 million - \$1.2 billion. Dr. Booth  
30 believes that “we may yet see a Canadian utility suffer a material loss with the  
31 TransCanada Mainline being the main candidate.”<sup>23</sup> This scenario is obviously one with

---

<sup>20</sup> 2013 GRA, at 35-36.

<sup>21</sup> “Emera Inc.,” Credit Suisse, July 20, 2012.

<sup>22</sup> “TransCanada Cuts Output Forecasts as Industry Malaise Deepens,” The Globe and Mail, June 19, 2012.

<sup>23</sup> Booth response to NSPI Information Request IR-36.

**REPLY EVIDENCE OF JAMES M. COYNE**

1 significant risks for TransCanada’s shareholders, and describes the risks that even  
2 regulated utilities must bear.

3 Third, the deferral account remains an asset that is subject to Nova Scotia Utility and  
4 Review Board (“NSUARB”) review before any amortization of that asset is incorporated  
5 in rates. As noted earlier, the ongoing Liberty audit of the Fuel Adjustment Mechanism  
6 is a primary example of just such a review, standing in stark contrast to Dr. Booth’s belief  
7 that “whenever a risk arises that seriously threatens a utility it is brought before the  
8 regulator and invariably the utility is protected.”<sup>24</sup>

9

10 **Q22. IS THE COMPANY’S BUSINESS RISK REDUCED BY THE FACT THAT THE**  
11 **BOWATER PLANT AND A PORTION OF THE NEWPAGE PLANT ARE NO**  
12 **LONGER A PART OF NSPI’S CUSTOMER BASE?**

13 **A22.** No, it is not. The Company has proposed to take a 30% equity stake in the NewPage  
14 plant in order to be sure that the plant is capitalized sufficiently, and NSPI took over the  
15 engineering procurement and construction (“EPC”) responsibility for the NewPage  
16 biomass plant as part of this transaction, further subjecting the Company to EPC risk until  
17 the plant is completed. These actions increase, rather than decrease the Company’s  
18 exposure to the troubled pulp and paper sector and to NewPage specifically. While the  
19 closure of the Bowater plant and only partial re-opening of the NewPage plant will  
20 reduce NSPI’s exposure to the industrial customer class by approximately 1,500 GWh  
21 per year, these two examples highlight the risk of NSPI’s ongoing exposure to more than  
22 2,400 GWh per year of remaining industrial load. Finally, the Company’s Demand-Side  
23 Management (“DSM”) program also subjects the company to load loss in the event that  
24 actual DSM results exceed the Company’s DSM forecast.

25

---

<sup>24</sup> Booth, at 27.

## REPLY EVIDENCE OF JAMES M. COYNE

1 Q23. **DR. BOOTH STATES ON PAGE 27 OF HIS EVIDENCE THAT, GIVEN NSPI'S**  
2 **FUEL ADJUSTMENT MECHANISM, RISKS RELATED TO FUEL**  
3 **PURCHASES ARE "BORNE BY UTILITY RATEPAYERS AND NOT NSPI'S**  
4 **SHAREHOLDER." DO YOU AGREE?**

5 A23. Not entirely. In general, the FAM does provide substantial protection against fuel price  
6 variability for NSPI's equity holders, but it provides far from complete protection. The  
7 NSUARB retains the authority to review the FAM in order to determine that NSPI's fuel  
8 procurement operations were conducted in a prudent manner. For example, at issue in  
9 the 2013 GRA is a prudence investigation into NSPI's natural gas procurement actions in  
10 2008 with regard to gas purchases during the 2010 and 2011 FAM period. Liberty  
11 Consulting, which was hired by the NSUARB to conduct an audit of these procurement  
12 activities, has identified several procurement decisions made by NSPI as being  
13 imprudent, and has recommended to the NSUARB that more than \$22 million in fuel  
14 procurement and associated plant costs should be disallowed.<sup>25</sup> NSPI and its consultants,  
15 including Concentric consultant John J. Reed, find no basis for this assessment and  
16 disagree with its conclusions. Nonetheless, the NSUARB's ability to review the  
17 prudence of NSPI's fuel purchases under the FAM leaves the Company vulnerable to the  
18 risk of disallowance through the current proceeding or through similar proceedings in the  
19 future.

20

21 Q24. **DOES DR. BOOTH FAIRLY ACCOUNT FOR THE BUSINESS RISK IMPACTS**  
22 **OF GOVERNMENTAL ENERGY POLICY ON NSPI?**

23 A24. No. Dr. Booth takes the "tremendous opportunities" statement from Emera's Annual  
24 Report without a fair characterization of the overall context presented. The Emera  
25 Annual Report statement cited by Dr. Booth refers to the overall corporate strategy of  
26 transformation to a lower carbon energy mix, and not to the specific requirements of  
27 governmental policies and risks to NSPI. Those impacts are referenced on the same  
28 page, which Dr. Booth seems to have ignored.

29 In Nova Scotia, we continue to focus on meeting the province's legislated  
30 renewable energy standards, which require 25 per cent of our generation to

---

<sup>25</sup> "Confidential Report to the NSUARB," July 9, 2012, Liberty Consulting Group, at IV-28, V-20 and V-25. Includes \$12.8 million in recommended deferrals related to hedging activities.

**REPLY EVIDENCE OF JAMES M. COYNE**

1           come from renewable sources by 2015, and 40 per cent by 2020. We are  
 2           on track to meet these targets, with Nova Scotia Power's (NSPI's)  
 3           renewables comprising 17 per cent of the generation mix in 2011. NSPI's  
 4           CO2 emissions last year were the lowest since 1999, and the percentage of  
 5           coal and heavy fuel oil in NSPI's generation mix was the lowest in the  
 6           company's history, 57 per cent of total generation compared with 80 per  
 7           cent only five years ago.<sup>26</sup>

8  
 9           Notwithstanding Dr. Booth's mischaracterization, every "opportunity" at NSPI or in  
 10          Emera's unregulated businesses also represent risks. Requiring a company to transform  
 11          its generation mix is not business as usual for an integrated utility such as NSPI, and it  
 12          undoubtedly increases business risk.

**Q25. HOW DOES INCREASED INVESTMENT INCREASE BUSINESS RISK?**

13  
 14          A25. Increased investment for a regulated utility creates risk in two ways: increased cash  
 15          outlays without matching cash inflows during the construction period, and the potential  
 16          for rate disallowances or deferrals. On this point, S&P expresses concerns for the  
 17          impacts of these requirements for NSPI's credit rating:  
 18

19           The Nova Scotia government recently introduced amendments to its  
 20           legislation that will increase the percentage of renewable energy in the  
 21           generation mix to 25% in 2015 and 40% in 2020. Consequently, consistent  
 22           with the initiatives and its own focused-growth strategy, we expect NSPI  
 23           to make significant capital expenditures in the near-to-medium term.  
 24           However, we view these expenditures in a regulatory context, which  
 25           provides limited cash flow relief during construction for multiyear  
 26           projects; and a balanced-but-measured perspective on yearly rate  
 27           applications, leading to large rate increases.

28  
 29           As a result, we believe NSPI's near-term credit metrics could weaken  
 30           because of the timing difference between the regulatory asset's  
 31           development (with the resulting debt) and the commencement of cash flow  
 32           in the context of heightened regulatory risk. The extent to which this  
 33           occurs is a function of the heightened regulatory risk of limited rate  
 34           increases, the timing of such investments in conjunction with the capital  
 35           structure employed with respect to the projects' development.<sup>27</sup>  
 36

<sup>26</sup> Emera 2011 Annual report, Page 2.

<sup>27</sup> Standard & Poors, Global Credit Portal, Ratings Direct, Nova Scotia Power Inc., April 18, 2012, at 2.

**REPLY EVIDENCE OF JAMES M. COYNE**

1 **Q26. DOES THE COMPANY BEAR OTHER RISKS REGARDING THE RECOVERY**  
 2 **OF ITS FIXED COSTS?**

3 A26. Yes, it faces the risk of non-recovery of fixed costs related to the potential exit of  
 4 municipal utilities wholesale customers. There are six municipal utilities in Nova Scotia  
 5 that are current wholesale customers of NSPI and that have indicated that they would like  
 6 to move to a supplier other than NSPI. As a result NSPI has requested in its 2013  
 7 General Rate Application that the approximately \$7 million in fixed costs associated with  
 8 those customers would be recovered through exit fees.<sup>28</sup> However, the municipal utilities  
 9 involved contend that NSPI's proposed mechanism for recovering these fees, the  
 10 Embedded Cost Recovery Mechanism ("ECRM"), is in violation of a 2005 Consensus  
 11 Proposal that, according to the municipal utilities, explicitly exempts the municipal  
 12 utilities from paying an exit fee.<sup>29</sup> On September 6, 2012, the NSUARB issued its  
 13 decision denying NSPI's request for an ECRM and, without making a finding on the  
 14 point, stated, "Having foregone the opportunity to recover stranded costs from the MEUs,  
 15 it is not at all clear that NSPI should be entitled to claim those stranded costs from other  
 16 customers."<sup>30</sup> This is a clear example of business risk that remains with NSPI.

17  
 18 **Q27. DOES THE COMPANY'S PROPOSED TWO-YEAR RATE APPROVAL**  
 19 **REDUCE BUSINESS RISK AS MS. SMITH SUGGESTS?**<sup>31</sup>

20 A27. No, it does not. A longer approval period presents the Company with the greater  
 21 likelihood of actual outcomes differing from the Company's forecast. This creates higher  
 22 risk than having to forecast for just a single year. While there is just as much chance that  
 23 the Company will over-forecast as there is that it will under-forecast, this uncertainty  
 24 presents risk to equity holders. Under the proposed rate stabilization plan, any realized  
 25 upside risk is passed on to ratepayers while any downside risk is held for shareholders.

26

<sup>30</sup> 2012 NSUARB 133, at paragraph 52.

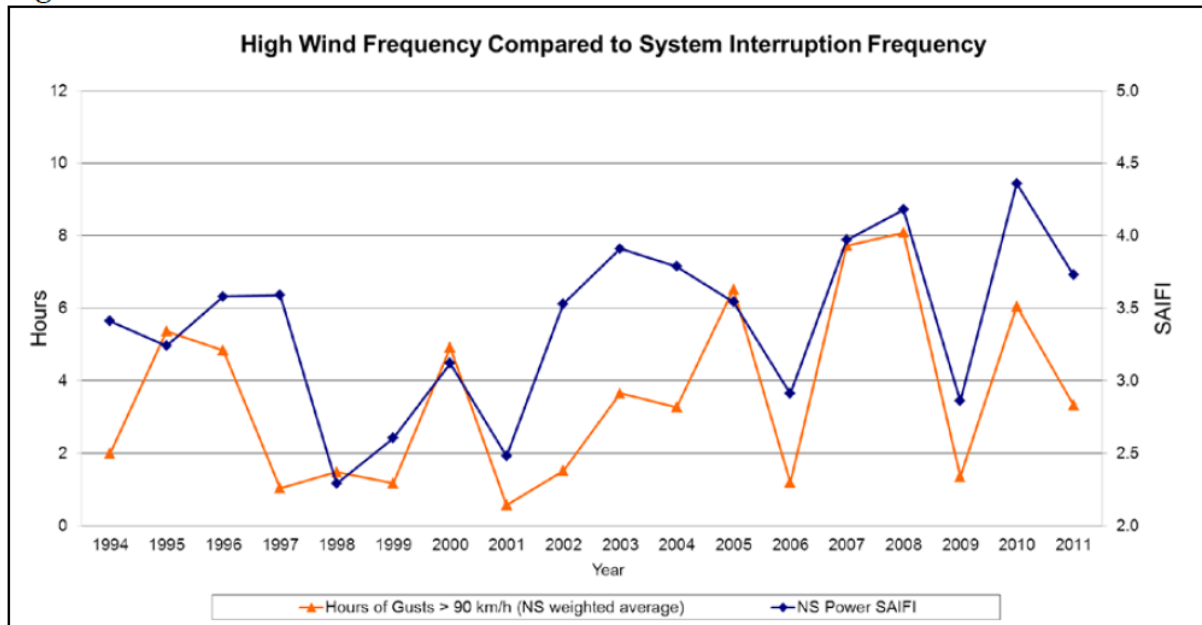

<sup>31</sup> Smith, at 10.

## REPLY EVIDENCE OF JAMES M. COYNE

1 Q28. IS IT TRUE THAT THE COMPANY'S RELIABILITY INDICES DO NOT  
 2 INDICATE AN INCREASING RELIABILITY PROBLEM, AS MS. SMITH  
 3 SUGGESTS?<sup>32</sup>

4 A28. No, it is not. Figure 6-7 in the Company's 2013 General Rate Application, which is  
 5 reproduced below, clearly shows an increasing trend in SAIFI since 2001.

Figure 6-7

6 Source: NSPI 2013 General Rate Application, Figure 6-7.

7  
 8 Ms. Smith also provides NSPI's SAIDI and CAIDI statistics. I observe that since 2003  
 9 the SAIDI statistic has been noticeably higher than it was in 2000-2002. The CAIDI  
 10 statistic, which measures the average amount of time a customer is without power per  
 11 interruption, can be misleading because a low CAIDI can simply mean that the utility is  
 12 experiencing more outages of shorter duration.<sup>33</sup>

13  
 14 Q29. WHAT DO YOU CONCLUDE WITH REGARD TO THE BUSINESS RISKS  
 15 DISCUSSED BY MS. MCSHANE IN HER DIRECT EVIDENCE?

16 A29. I agree with Ms. McShane regarding the primary business risks that NSPI faces. In her  
 17 direct evidence, Ms. McShane describes business risks related to 1) the weak economy in  
 18 NSPI's service area; 2) the risks of maintaining a reliable generation fleet that, through a

<sup>32</sup> Smith, at 8-9.

<sup>33</sup> "Reliability: Beyond the Numbers," Burns & McDonnell, at 4.

**REPLY EVIDENCE OF JAMES M. COYNE**

1 substantial capital expenditures program, is also made to comply with provincial and  
 2 federal regulatory requirements with respect to greenhouse gases and renewable  
 3 electricity standards; 3) the uncertainty of load, and the related deferral of fixed costs  
 4 with respect to lost load; and 4) the fact that NSPI has few if any peers in Canada with  
 5 respect to the risks presented by its generating portfolio. Dr. Booth himself would  
 6 “expect utilities without low-cost power, such as hydro, and without a protective  
 7 regulator to be allowed higher ROEs reflecting the risks attached to the cost of purchased  
 8 power.”<sup>34</sup> All of these risks, which I have described in my testimony, lead me to the  
 9 same conclusion drawn by Ms. McShane: NSPI’s business risks are unique and  
 10 substantial, and do not compare well with other utilities in Canada. The next section of  
 11 my testimony describes the appropriateness of looking to U.S. integrated utilities as a  
 12 better proxy for the risks borne by NSPI.

13  
***IV. THE USE OF U.S. VS. CANADIAN PROXY GROUPS***

14 **Q30. DO YOU AGREE WITH DR. BOOTH’S ASSESSMENT THAT THE U.S. AND**  
 15 **CANADA ARE SO DIFFERENT THAT AN ADJUSTMENT IS REQUIRED IN**  
 16 **ORDER TO ESTIMATE ROE BASED ON A U.S. PROXY GROUP?**

17 **A30.** No, I do not. Dr. Booth presents the following objections to the use of U.S. data in  
 18 establishing comparability between Canadian and U.S. utilities: a) U.S. financial markets  
 19 exhibit more risk than Canadian markets; and b) although the principles of regulation are  
 20 the same between the U.S. and Canada, the implementation is different.

21 Below, I refute Booth’s premise that macroeconomic financial conditions and markets in  
 22 the U.S. are more risky than in Canada. In this, I review his overly general comparisons  
 23 that do not portray an accurate picture of financial conditions and markets between  
 24 Canada and the U.S. Secondly, I show how the NEB, the OEB, and the British Columbia  
 25 Utilities Commission (“BCUC”) believe that the use of U.S. utilities in ROE proxy  
 26 groups is necessary and reasonable. Finally, I discuss the similarities between Nova  
 27 Scotia and the U.S.’s economic and financial environments.

28  

---

<sup>34</sup> Booth response to NSPI Information Request, IR-25.

## REPLY EVIDENCE OF JAMES M. COYNE

1 Q31. DO YOU BELIEVE THE U.S. DECISION TO LET LEHMAN BROTHERS GO  
 2 INTO BANKRUPTCY HAS ANY RELEVANCE OR BEARING ON THE  
 3 ALLOWED ROE'S OF NORTH AMERICAN PUBLICALLY TRADED UTILITY  
 4 COMPANIES IN 2012?<sup>35</sup>

5 A31. No, I do not. The Lehman Brothers bankruptcy was only one of several complex factors  
 6 that led to the global economic crisis. Since that time, government regulators have  
 7 strengthened their controls over banking and financial systems on a global basis. There is  
 8 no evidence whatsoever that utility investors in Canada or the U.S. factor this single  
 9 event into their cost of capital requirements.

10

11 Q32. IS DR. BOOTH'S COMPARISON OF MACROECONOMIC FINANCIAL  
 12 CONDITIONS BETWEEN CANADIAN AND U.S. ECONOMIES ACCURATE?<sup>36</sup>

13 A32. No. Although Dr. Booth may insist that the Canadian economy is thriving, Standard &  
 14 Poor's ("S&P") would suggest quite the contrary. In its recent Global Credit Report,  
 15 S&P notes that:

16 Canada's economic recovery lost momentum in the second half of 2011.  
 17 Although trade with other countries improved and export growth  
 18 rebounded, Canada's consumers and businesses restrained their spending,  
 19 meaning that GDP growth suffered. We don't expect the recovery's  
 20 momentum to start building again anytime soon because Canadian  
 21 companies appear to be positioning themselves for a global slowdown.  
 22 Planned investment spending could be postponed as Canadian companies  
 23 weigh the risks to their operations and consider the potential fallout from  
 24 the Eurozone sovereign debt crisis. The slowdown in employment growth  
 25 and increases in Canada's national unemployment rate since October 2011  
 26 might be a sign that these influences are already rippling through the  
 27 economy.<sup>37</sup>

28

29 S&P also states that it does not believe the Canadian economy will hit its stride until  
 30 2014.<sup>38</sup> As demonstrated later in this evidence, the macroeconomic financial conditions  
 31 of Canada and U.S. are more similar than Dr. Booth would like to admit.

32

<sup>36</sup> *Ibid.*, at 86, line 9, through 87, line 20.

<sup>37</sup> Industry Report Card: Growth Poses Biggest Challenge to an Otherwise Stable Canadian Midstream and Utility Sector, Global Credit Portal, Standard & Poor's, February 15, 2012, at 2.

<sup>38</sup> *Ibid.*, at 3.

## REPLY EVIDENCE OF JAMES M. COYNE

1 Q33. **HAVE INSTITUTIONAL BODIES ANALYZED HOW MARKET SHOCKS,**  
 2 **LIKE THE LEHMAN BROTHERS FAILURE IN THE U.S. ECONOMY ARE**  
 3 **TRANSMITTED TO THE CANADIAN ECONOMY?**

4 A33. Yes. A Discussion Paper presented by the Bank of Canada discusses how U.S. financial  
 5 shocks are transmitted to Canada. The Discussion Paper notes that:

6 For Canada in particular, developments in U.S. economic activity and  
 7 financial conditions are likely to exert a significant effect on the Canadian  
 8 business cycle. Historically, the effect of the U.S. business cycle on the  
 9 Canadian business cycle has generally been studied through trade  
 10 linkages, since the United States represents about three-quarters of  
 11 Canadian trade. However, there are also strong financial linkages between  
 12 Canada and the United States. For example, Canadian non-financial  
 13 corporations rely on U.S. financing, since about 20 per cent of shares of  
 14 Canadian firms are held by U.S. residents. Moreover, foreign loans  
 15 typically account for about 40 per cent of total bank loans to the Canadian  
 16 non-bank sector, highlighting the importance of foreign credit for Canada.  
 17 [excluding mortgages] Therefore, developments in U.S. financial  
 18 conditions may exert a significant effect on the Canadian business cycle.<sup>39</sup>

19 Clearly, Canada was not a “bystander” during the 2008 financial crisis as Dr. Booth  
 20 asserts,<sup>40</sup> but rather a full-fledged trading and investment partner with shared national and  
 21 economic interests as its closest trading partner.

22

23 Q34. **DO YOU AGREE WITH DR. BOOTH THAT THE IMPLEMENTATION OF**  
 24 **UTILITY REGULATION IN CANADA IS DIFFERENT THAN IT IS IN THE**  
 25 **U.S.?**

26 A34. No, I do not. My experience is that the two countries are more alike than they are  
 27 different. This view was shared by the NEB in its TransQuébec and Maritimes Pipeline  
 28 (“TQM”) Decision, when the Board found that the regulatory regimes in Canada and the  
 29 U.S. are sufficiently similar as to justify comparison. This issue is addressed by the  
 30 NEB, where the Board dismisses such singular events as evidence of non-comparability:

31 The Board is not persuaded that the U.S. regulatory system exposes  
 32 utilities to notable risks of major losses due either to unusual events or  
 33 cost disallowances. The Board views the losses and disallowances

---

<sup>39</sup> Financial Spillovers Across Countries: The Case of Canada and the United States, Bank of Canada Discussion Paper, 2011-1, Kimberly Beaton and Brigitte Desroches, January, 2011, at 1.

<sup>40</sup> Booth, at 86, line 18.

## REPLY EVIDENCE OF JAMES M. COYNE

1 experienced by U.S. regulated entities as a result of the restructuring that  
 2 took place to terminate the merchant gas function of pipelines, as well as  
 3 some other circumstances such as the Duquesne nuclear build, to be, to a  
 4 large extent, unique events. The Board also finds that such instances are  
 5 not likely to weigh significantly in investors' perceptions today, and would  
 6 thus have little or no impact on cost of capital.<sup>41</sup>

7 Likewise, the OEB concluded that the U.S. is a relevant source of comparable data and  
 8 that it often looks to the U.S. to inform its decisions.

9 The Board is of the view that the U.S. is a relevant source for comparable  
 10 data. The Board often looks to the regulatory policies of State and Federal  
 11 agencies in the United States for guidance on regulatory issues in the  
 12 province of Ontario. For example, in recent consultations, the Board has  
 13 been informed by U.S. regulatory policies relating to low income customer  
 14 concerns, transmission cost connection responsibility for renewable  
 15 generation, and productivity factors for 3rd generation incentive  
 16 ratemaking.

17  
 18 Finally, the Board agrees with Enbridge that, while it is possible to  
 19 conduct DCF and CAPM analyses on publicly-traded Canadian utility  
 20 holding companies of comparable risk, there are relatively few of these  
 21 companies. As a result, the Board concludes that North American gas and  
 22 electric utilities provide a relevant and objective source of data for  
 23 comparison.<sup>42</sup>

24  
 25 Finally, the BCUC stated the following in 2009:

26 In addition, the Commission Panel continues to be prepared to accept the  
 27 use of historical and forecast data of U.S. utilities when applied: as a  
 28 check to Canadian data, as a substitute for Canadian data when Canadian  
 29 data do not exist in significant quantity or quality, or as a supplement to  
 30 Canadian data when Canadian data gives unreliable results.<sup>43</sup>

31  
 32 **Q35. PLEASE DISCUSS THE NEB'S TQM DECISION FURTHER.**

33 A35. In its TQM Decision, the NEB found that U.S. market returns are relevant to the cost of  
 34 capital for Canadian firms, and that the regulatory regimes in Canada and the U.S. are  
 35 sufficiently similar as to justify comparison. Unlike Dr. Booth, the NEB appears to view  
 36 U.S. market returns as valuable information in terms of establishing the cost of capital for

<sup>41</sup> NEB Reasons for Decision, TQM RH-1-2008 (March 2009) at 67.

<sup>42</sup> *Ibid.*, at 23.

<sup>43</sup> British Columbia Utilities Commission, In the Matter of Terasen Gas, Inc., Terasen Gas (Vancouver Island), Inc. Terasen Gas (Whistler) Inc. and Return on Equity Capital Structure, Decision, December 16, 2009.

**REPLY EVIDENCE OF JAMES M. COYNE**

1 Canadian utilities. Similarly, the NEB found that Canadian utilities are competing for  
 2 capital in global financial markets that are increasingly integrated. The NEB recognized  
 3 that it is no longer possible to view Canada as insulated from the remainder of the  
 4 investing world, and that doing so would be detrimental to the ability of Canadian  
 5 utilities to compete for capital.<sup>44</sup>

6 This finding suggests that it is reasonable and appropriate for Ms. McShane to consider  
 7 the investment returns provided by U.S. utilities when assessing whether the allowed  
 8 ROE in Nova Scotia satisfies the Fair Return Standard. Further, it suggests that it is  
 9 reasonable and appropriate to consider a proxy group of U.S. gas and electric companies  
 10 as sufficiently comparable to Canadian regulated utilities in terms of their risk profile.  
 11 Importantly, the NEB also found that the regulatory regimes in the U.S. and Canada were  
 12 sufficiently similar as to justify comparison between utilities in the two countries.

13  
 14 **Q36. HAVE YOU DONE ANY FURTHER RESEARCH OR ANALYSIS THAT**  
 15 **COMPARES THE U.S. AND CANADIAN REGULATORY CONDITIONS?**

16 **A36.** Yes, I have analyzed the use of deferral accounts and other risk mitigating regulatory  
 17 practices for both Canadian utilities and U.S. utilities and found no material differences  
 18 in the use of these mechanisms.<sup>45</sup> Specifically, many U.S. utilities have been allowed to  
 19 implement further risk protection features such as revenue stabilization mechanisms to  
 20 address declining average use per customer and cost tracking mechanisms to facilitate  
 21 replacement of aging gas and electric infrastructure. Many utilities with significant  
 22 capital expansion programs are allowed a cash return on Construction Work in Progress  
 23 (“CWIP”). These types of risk protection measures appear to be less common among  
 24 Canadian regulated utilities based on my review of shareholder annual reports and  
 25 regulatory filings.

<sup>44</sup> NEB Reasons for Decision, TQM RH-1-2008 (March 2009).

**REPLY EVIDENCE OF JAMES M. COYNE**

1 **Q37. PLEASE DISCUSS WHY YOU BELIEVE IS IT IMPORTANT TO INCLUDE U.S.**  
2 **UTILITIES IN THE ANALYSIS OF CANADIAN ROE ESTIMATES?**

3 A37. In order for utilities to fund their operations, they must be able to attract capital on  
4 reasonable terms and conditions from investors with a broad array of alternative  
5 investment options (the capital attraction standard). In order to do so, utilities must offer  
6 returns that are comparable to enterprises of similar risk (the comparable investment  
7 standard). These elements of capital attraction and comparability of investment risk  
8 cannot be separated from the business and economic environment that frames capital  
9 market and investor expectations. In a world of increasingly linked economies and  
10 capital markets, investors seek returns from a global basket of investment options.  
11 Investors discriminate between risks on a country-to-country basis, factoring in the  
12 comparability of the economies and the business environments.

13

14 **Q38. HAS INVESTMENT RISK BEEN COMPARED ON A COUNTRY BY COUNTRY**  
15 **BASIS?**

16 A38. Yes. Country-specific economic and business conditions that affect investment risk may  
17 be measured through a variety of qualitative and quantitative metrics. One such measure,  
18 produced by the Economist Intelligence Unit (affiliated with the Economist magazine),  
19 provides a ranking of the world's largest economies based on a range of factors impacting  
20 the business environment. This report is produced in conjunction with the Columbia  
21 University Program on International Development. According to the report, "The  
22 business rankings model measures the quality or attractiveness of the business  
23 environment in the 82 countries covered by Country Forecasts using a standard analytical  
24 framework. It is designed to reflect the main criteria used by companies to formulate  
25 their global business strategies, and is based not only on historical conditions but also on  
26 expectations about conditions prevailing over the next five years." ... "The business  
27 rankings model examines [91 indicators] in ten separate criteria or categories, covering  
28 the political environment, the macroeconomic environment, market opportunities, policy

## REPLY EVIDENCE OF JAMES M. COYNE

1 towards free enterprise and competition, policy towards foreign investment, foreign trade  
2 and exchange controls, taxes, financing, the labor market and infrastructure.”<sup>46</sup>

3 The business environment ranks are updated annually in individual country forecasts.  
4 Based on the April 2012 update, which provides both the historical 2007-2011 rank and  
5 the projected 2012-2016 rank out of 82 countries, Canada and the U.S. are ranked 4th and  
6 9th respectively over the historic period, and 5th and 9th over the projected five years.  
7 This report suggests that from a business investment perspective, Canada and the U.S. are  
8 highly comparable in a global context.

9 The World Economic Forum also publishes its annual *Global Competitiveness Report*,  
10 which ranks 142 countries on twelve economic factors, including institutions,  
11 infrastructure, the macroeconomic environment, health and primary education, higher  
12 education and training, goods market efficiency, labor market efficiency, financial market  
13 development, technological readiness, market size, business sophistication, and  
14 innovation.<sup>47</sup> According to the 2011-2012 report, Canada is ranked 12th and the U.S. is  
15 ranked 5th in competitiveness and productivity.<sup>48</sup> The report describes the Global  
16 Competitiveness Index as “a comprehensive tool that measures the microeconomic and  
17 macroeconomic foundations of national competitiveness.”<sup>49</sup> The report further explains:  
18 “We define competitiveness as the set of institutions, policies, and factors that determine  
19 the level of productivity of a country. The level of productivity, in turn, sets the level of  
20 prosperity that can be earned by an economy. The productivity level also determines the  
21 rates of return obtained by investments in an economy, which in turn are the fundamental  
22 drivers of its growth rates.”<sup>50</sup> In a recent update to the Global Competitiveness Index,  
23 Canada has slipped from 12<sup>th</sup> to 14<sup>th</sup>, and the U.S. from 5<sup>th</sup> to 7<sup>th</sup>.<sup>51</sup>

<sup>50</sup> *Ibid.*

<sup>51</sup> Globe and Mail, September 6, 2012, at B3.

**REPLY EVIDENCE OF JAMES M. COYNE**

1 **Q39. HAVE YOU COMPARED THE OVERALL ECONOMIC AND INVESTMENT**  
2 **ENVIRONMENT BETWEEN CANADA AND THE U.S.?**

3 A39. Yes, Exhibit JMC-2 presents several measures that reflect the overall economic and  
4 investment environment in Canada and the U.S. The first measure compares the returns  
5 to investors from the TSE 300 and S&P 500 stock indices. The total return on the TSE  
6 300 has been 4.0% higher than the S&P 500 over the past ten years and 1.7% higher over  
7 the past five years. Turning to the Utility Stock Index, U.S. utilities outperformed their  
8 Canadian counterparts in five of the last nine years.<sup>52</sup> While the broader market returns  
9 were higher for Canadian companies over the most recent ten and five year periods,  
10 average total returns for Canadian and U.S. utility investors have been very similar  
11 between 2003 and 2011 (i.e., 12.77% vs. 12.90%).<sup>53</sup>

12 As also shown on Exhibit JMC-2, the correlation between real GDP growth rates in the  
13 two countries is strong, as is the correlation between the consumer price indices for each  
14 country, indicating that these metrics tend to move together over time between the two  
15 countries. Over the 25-year period, real GDP growth has been 2.50% in Canada and  
16 2.58% in the U.S., while consumer inflation has been 2.44% in Canada and 2.92% in the  
17 U.S. Unemployment rates over the 25 year and ten year periods have been substantially  
18 higher in Canada (e.g., 7.51% in Canada vs. 5.94% in the U.S. since 1987), but that trend  
19 reversed since 2009 as the U.S. has been slower to recover from the recent recession.

20

21 **Q40. HAVE YOU ALSO ANALYZED AND COMPARED BOND YIELDS BETWEEN**  
22 **CANADA AND THE U.S.?**

23 A40. Yes. The average yields on 10-year government bonds have also been very similar in  
24 Canada and the U.S. over the past decade. Specifically, the average yield on 10-year  
25 Canadian government bonds has been 4.01%, while the average yield on U.S. Treasury  
26 bonds has been 3.95%. During 2011, the average yield on 10-year government bonds  
27 was 2.78 in Canada and 2.79 in the U.S. Today, the relative 10-year bond yields stand at  
28 1.74% in Canada and 1.59% in the U.S.<sup>54</sup> The correlation between average annual

---

<sup>52</sup> Dividend data for the S&P/TSX Utilities Index is not available prior to 2003.

<sup>53</sup> Source: Bloomberg Professional Service. Return includes both price appreciation and dividend yield. Dividend data for the S&P/TSX Utilities Index were not available prior to 2003.

<sup>54</sup> Canadian bond data from Bank of Canada. US bond data from U.S. Federal Reserve for September 4, 2012.

**REPLY EVIDENCE OF JAMES M. COYNE**

1 interest rates on 10-year government bonds in Canada and the U.S. since 1987 has been  
2 0.98; similarly, the correlation between daily average interest rates on 10-year  
3 government bonds in Canada and U.S. from 2008 through 2011 has been 0.99, as central  
4 banks in both countries responded to the credit crisis and financial market dislocation by  
5 providing supportive monetary policy. Correlations of this degree are certainly reflective  
6 of closely integrated financial markets. Those low interest rates on government bonds  
7 reflect the risk aversion in global financial markets, as investors sought the relative safety  
8 of government bonds rather than assuming the risks associated with equity ownership.

9  
10 **Q41. WHAT DO YOU CONCLUDE FROM AN INVESTERS STANDPOINT?**

11 A41. Based on those macroeconomic indicators, there are no fundamental dissimilarities  
12 between Canada and the U.S. (i.e., in terms of economic growth, inflation,  
13 unemployment, or government bond yields) which would warrant significant differences  
14 in investors' return expectations. Furthermore, the magnitude and significance of trade  
15 between the two countries indicates the high degree of integration between the two  
16 markets. In 2011, in terms of trade in goods, 73.7% of Canada's total exports went to the  
17 U.S., and imports from the U.S. accounted for 49.5% of Canada's total imports.<sup>55</sup>

18 The value of the Canadian dollar has fluctuated versus the U.S. dollar (as with all  
19 currencies) over the past 25 years. The Canadian dollar fell to \$1.57 per U.S. dollar in  
20 2002 before rebounding to \$0.99 in 2011; it currently stands at \$0.99 as of August 31,  
21 2012.<sup>56</sup> Consensus Forecasts projects that exchange rates between the Canadian and  
22 U.S. dollar are expected to remain relatively stable through 2014.<sup>57</sup> For a Canadian  
23 investor, while the fluctuation in exchange rates over the past decade does not affect an  
24 investment in a Canadian utility, it does affect the value of U.S. utility investments. The  
25 same is true reciprocally for a U.S. investor.

26 On balance, the economic and business environments of Canada and the U.S. are highly  
27 integrated and exhibit strong correlation across a variety of metrics. It is no accident that  
28 Canadian utilities, such as Emera, Fortis BC, AltaGas, TransCanada Pipelines, Hydro One

## REPLY EVIDENCE OF JAMES M. COYNE

1 and Ontario Power Generation, and Enbridge have recently moved to adopt US GAAP for  
 2 accounting and regulatory reporting standards.<sup>58</sup> From a business risk perspective,  
 3 including overall business environment and competitiveness, Canada and the U.S. are  
 4 ranked closely when compared against other developed and developing countries. The  
 5 capital markets are highly integrated. Based on these metrics and qualitative assessments,  
 6 it is reasonable to conclude that over the long term a reasonable investor would prudently  
 7 expect comparable returns from the two countries. Therefore, I conclude that there is no  
 8 justification for an adjustment to investor returns to reflect differences in economic or  
 9 institutional risk between Canada and the U.S. Unlike Dr. Booth, who concludes that the  
 10 U.S., Europe and Canada are on different trajectories<sup>59</sup>, I believe a more accurate  
 11 description is that offered in response to the Bank of Canada's strategy, "The Canadian  
 12 economy is like a boat in the ocean, our economic fortunes are dictated by what's going  
 13 on in the rest of the world."<sup>60</sup>

14  
 15 **Q42. WHAT IS THE STATE OF THE NOVA SCOTIA ECONOMY, RELATIVE TO**  
 16 **THE CANADIAN ECONOMY AS A WHOLE?**

17 A42. As shown by the statistics provided in Exhibit JMC-1, Nova Scotia's economic recovery  
 18 has been among the slowest of all the Canadian provinces, but it compares favorably with  
 19 the economic recovery in the U.S. Nova Scotia's real GDP growth of only 1.6 percent in  
 20 2010 and 0.3 percent in 2011 compares to average real GDP growth of 2.8 percent in that  
 21 two-year period for Canada as a whole and 2.1 percent for the U.S. in that period.  
 22 Similarly, Nova Scotia's unemployment rate, while having fallen to 7.7 percent in 2011,  
 23 was higher in that year than all other provinces except Prince Edward Island,  
 24 Newfoundland and New Brunswick, and has not yet recovered from its 2007 pre-  
 25 recession rate of 6.9 percent. The 2011 unemployment rate for Canada as a whole was  
 26 6.5 percent. The 2011 unemployment rate in the U.S. was 8.9 percent. From these  
 27 figures I conclude that the U.S. and Canada are both recovering slowly from the

1 recession, but that Nova Scotia's rate of recovery compares more favorably to that of the  
2 U.S. than it does to that of other provinces.  
3

**V. CONCLUSIONS****Q43. WHAT DO YOU CONCLUDE REGARDING NSPI'S BUSINESS RISKS?**

4 A43. If anything, the Company's business risk has increased since the fall of 2011 when the  
5 rate decision of the 2012 GRA was being drafted. In November 2011, Standard and  
6 Poor's downgraded the Company's outlook to "Negative", based primarily on the  
7 Company's significant capital expenditures program related to energy policies at both the  
8 federal and provincial levels."<sup>61</sup> In May 2012 and as part of 2013 GRA, the Company  
9 produced a load forecast for 2013 that was more than 15 percent lower than the previous  
10 forecast it made for 2012.<sup>62</sup> And in June 2012 the Bowater plant announced that it would  
11 remain permanently closed. Together, these events point to the Company's increasing  
12 business risk.  
13

14 Further, there is ample evidence that NSPI's business risk is greater than that of the other  
15 regulated Canadian gas and electric distributors cited by Dr. Booth, and at least  
16 comparable, if not greater risk than the U.S. proxy group sample utilized by Ms.  
17 McShane. The evidence ultimately suggests that NSPI's requested continuation of its  
18 existing ROE and common equity ratio are conservative and to the benefit of the  
19 Company's ratepayers.  
20

**Q44. DOES THIS CONCLUDE YOUR DIRECT TESTIMONY?**

21 A44. Yes, it does.  
22

## NOVA SCOTIA UTILITY AND REVIEW BOARD

**IN THE MATTER OF:** The *Public Utilities Act*, R.S.N.S. 1989, c.380 as amended

**IN THE MATTER OF:** An Application by Nova Scotia Power Incorporated for Approval of Certain Revisions to its Rates, Charges and Regulations

## RESPONSE TO INFORMATION REQUEST

**TO:** NSPI

**FROM:** UARB

---

**Question IR-73:** Appendix G

- a. **Page 5, (last line but one): Provide an explanation of why wind assets are assigned 30% to 3CP demand and the remaining plant to energy.**
- b. **Exhibit 7: Why isn't line 17 the same as Appendix A, Table 2, line 5, column 5?**
- c. **Exhibit 9A, line 8: Column 2 shows energy sales of 2,076.1 GW.h, the same value as used by NSPI in the ELIIR-2 hearing (P-883) for the cost of service study in SEB IR-1a. Column 6 shows a coincident demand of 264,400 KW versus the SEB IR-1a value of 247,000 KW. This results in a drop in customer load factor from 95.85% in SEB IR-1a to 89.64% in the present filing. Please provide an explanation for the higher peak demand forecast for this customer in the present filing while leaving energy sales constant between the two cost of service studies.**

**Response IR-73:** a. Wind energy is a variable resource. In Nova Scotia, the current installed wind generation has generally achieved approximately a 30 percent capacity factor, compared to nameplate rating. NSPI has used these results in the Cost of Service Study to assign 30 percent of wind assets to demand, with the remainder being assigned to energy.

**IN THE MATTER OF:** The *Public Utilities Act*, R.S.N.S. 1989, c.380 as amended

**IN THE MATTER OF:** An Application by Nova Scotia Power Incorporated for Approval of Certain Revisions to its Rates, Charges and Regulations

**RESPONSE TO INFORMATION REQUEST**

**TO:** NSPI

**FROM:** UARB

---

**Response IR-73:** (cont'd)

- b. The difference between Non-Rate Revenue of \$9.3 million in Exhibit 7, line 17 and Misc. Revenue of \$10.8 million in Table 2, line 5 of Appendix A is associated with \$1.5 million in Retail Sales. This Retail Sales figure when netted against Cost of Goods Sold of \$1.1 million in Table 2, line 10 of Appendix A results in a credit of \$0.4 million that is identified in Exhibit 4, Line 24 of Appendix G.
- c. The demand of 264,400 kW for 2007 is based on 2005 actual load shape information that was not available in the P-883 hearing.

## RE: LED Streetlights

Dear

As you are aware, the provincial government passed legislation on May 19, 2011 that will make LED lighting mandatory on Nova Scotia's roads and highways. Detailed regulations are available for public comment.

Nova Scotia Power Inc. (NSPI) is in the process of gathering customer information to formulate an implementation plan to meet these regulations. We will be requesting your input on how you'd like to work with NSPI on streetlights in your community. A second letter will be sent with specifics for your community in order to assist with your decision.

Going forward NSPI customers have 2 options:

1. Continue to rent streetlights from NSPI; or
2. Assume responsibility of ownership of streetlights in your area.

Under both options, you will be responsible for energy costs associated with your usage.

Customers will be responsible for the costs of the existing lights that have not yet been fully paid. We estimate this cost to be approximately \$175 per light based on our most recent assessment of un-depreciated costs for the total existing streetlight inventory, which equals \$23 million for the entire province. This amount will be subject to continued depreciation until the time of purchase or conversion. It is important to note that this amount will require approval by the Nova Scotia Utility and Review Board (NSUARB) during a future regulatory process, and are therefore only estimates at this time.

A pilot project is planned to be submitted for approval of the UARB to better understand the costs for installation of LED streetlights and other costs. The pilot project would see NSPI change a limited number of lights over a 12 month period in various areas of the province and collect data for a better assessment of the costs and reusable parts, if any.

We encourage customers to participate in the pilot by contacting us at the email or phone number below. If you choose to participate in the pilot, both the purchase and rent options will still be available to you until you make your final decision per draft regulations by June 30, 2013.

**Options:**

**1. Continue to Rent from NSPI**

Customers who choose to continue to rent streetlights from NSPI will pay the monthly UARB approved rate per light for the number of lights in their area. These lights will form a new asset pool, separate from existing streetlight asset pool.

NSPI will develop a plan to switch existing streetlights to LED streetlights in co-operation with customers who choose to continue to rent from NSPI.

**2. Assume Responsibility of Ownership of Streetlights in your Area**

Municipalities who wish to assume ownership of streetlights in their area should consider the following:

- a. When a municipality purchases the existing lights from NSPI at cost, the municipality will be able to use existing brackets to install municipally-owned LED lights on NSPI-owned poles. NSPI will continue to own the poles.
- b. Municipalities will be responsible for costs associated with the safe and environmentally responsible disposal of existing street light assets when

replaced by the new lights.

- c. You will need to establish a process for streetlight outage reporting in your area.
- d. NSPI will require an inventory of decommissioned lights and wattage of new LED lights installed. Once the change-out is completed, you will be billed on an approved energy-only rate.
- e. NSPI will no longer be responsible for the maintenance of your streetlights.
- f. Roadway lighting must comply with the Canadian Electrical Code Part I. You will need to ensure that this equipment is upgraded and inspected for compliance with the CEC.
- g. Only qualified technicians are allowed to install and maintain streetlights - please refer to Department of Labor Bulletin issued in March 2012.

If you would like to discuss your options or you have any further questions, please contact us at 428-6773 or [LEDStreetlightProjec@nspower.ca](mailto:LEDStreetlightProjec@nspower.ca)

Sincerely,

Judy O'Leary  
Customer Lead, LED Streetlight Replacement Project

Cc: Kerry Jennex, Acting Director Retail Operations
